FOREWORD

The General Population Census of Cambodia of 2019 provides a crucial opportunity to examine past achievements and to guide future development plans and strategies. Aware of the vital importance of the project, the Royal Government of Cambodia allocated major national resources towards the implementation of the Census.

I am gratified that the Census has been a success and that reliable and timely data will be made available to specialized users and the general public. In addition to the present document, a range of thematic reports will be generated by the National Institute of Statistics, with the assistance of specialists from various sectors, including academia.

On behalf of the Ministry of Planning, I would like to express our deep gratitude to **Samdech Akka Moha Sena Padei Techo HUN SEN, Prime Minister of the Kingdom of Cambodia**. His unwavering support has been integral to the successful completion of the Census. I would also like to extend our sincerest thanks to **Samdech Kralahorm Sar Kheng, Deputy Prime Minister, Minister of the Interior and Chairman of the National Census Committee (NCC)** and the others members of the Committee, for their guidance.

As Chair of the Technical Committee and the Publicity Committee for the General Population Census of Cambodia of 2019 - and on behalf of the Ministry of Planning – I would like to thank all members of the census committee working in the capital, provinces, municipalities, districts, khans and communes/sangkats. They did an excellent job and, by working together, we have been able to successfully implement our planned activities and obtain valuable results.

I would also like to thank the United Nations Population Program (UNFPA), the Swedish International Development Cooperation Agency (SIDA) and the Federal Republic of Germany and their implementer, the Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ) and the European Union (EU). Their financial and technical assistance supported the census planning and also the data entry, cleaning and analysis phases. They also provided training in report writing and helped draft the final census report.

I would like to thank **Dr Nott Rama Rao** for providing technical assistance in the census planning process and for reviewing all technical aspects of the census. And **Dr Ricardo Neupert**, Census Chief Technical Advisor, for providing overall technical assistance, particularly in writing the final census report. **Dr Arij Dekker** also provided much-appreciated help with the data cleaning and the preparation of the census priority tables. And **Kjell Tambour**, Senior Advisor with Statistics Sweden/SIDA, provided welcome assistance with the data processing.

I would like to express my special thanks to the Government of the People's Republic of China for providing material assistance worth a total of \$2.5 million to support the census. This valuable contribution included automobiles, motorcycles, desktops, laptops, printers, photocopiers, tablets, servers and other electronic devices.

Last but not least, I would like to express my gratitude and appreciation to all staff of the National Institute of Statistics. **H.E. Ms. Hang Lina**, Delegate of the Royal Government of Cambodia in-charge of Director-General of the National Institute of Statistics, who carefully coordinated all census operations, with the assistance of Deputy Directors-General **H.E. Sok Kosal**, **H.E. Saint Lundy** and **H.E. They Kheam**.

I would like to express particular thanks to all compatriots who supported and participated in the successful completion of census operations in the Kingdom of Cambodia in 2019.

It is hoped that ministries, international agencies, researchers and the public will find this report useful.

PREFACE

The General Population Census of Cambodia of 2019 was conducted, as planned, by the National Institute of Statistics. This census is the fourth in a series of national censuses, preceded by those of 1962, 1998 and 2008. The Census was undertaken from 3rd to 13th March 2019. This report presents the final results that the National Institute of Statistics has produced. The core theme of this report is the analysis of recent population growth and dynamics. The report discusses population size, as well as trends in fertility, mortality, migration and disability. It also includes a brief discussion of broader cross-cutting issues, such as literacy and education, economic activity and household characteristics and amenities. To further supplement these analyses, 17 additional thematic reports are expected to be issued in 2020 and 2021.

The Royal Government of Cambodia provided full financial support through the Ministry of Economy and Finance. I would like to thank the United Nations Population Fund (UNFPA) for undertaking the coordinating role for the Census and for their technical and financial support. I am also grateful to the People's Republic of China for supplying equipment such as vehicles, motorbikes, computers, printers and photocopiers. This equipment was essential to our census operations.

Finally, I would like to thank all staff of the National Institute of Statistics, as well as all Provincial Census Officers, District Census Officers, Commune Census Officers, Village Chiefs, Field Supervisors and Enumerators for their dedication and hard work. This has enabled us produce timely data of good quality. My acknowledgements would be incomplete if I did not also mention the general public, who provided this much-needed information without hesitation.

Delegate of Royal Government of Cambodia
In-charge of Director-General
of National Institute of Statistics

Ms. Hang Lina

Master's Degree/Ph.D Degree	0.6	0.8	0.3
Other vocational training certificate	0.03	0.04	0.02
Total	100.0	100.0	100.0

24. Percentage currently attending school/educational institution by age group and sex

Age Group	Total	Male	Female
06-11	90.6	90.1	91.1
12-14	91.6	90.4	92.8
15-17	67.6	66.2	69.1
18-24	20.7	22.1	19.3
25 +	0.7	0.8	0.6

25. Disability prevalence rate by degree and sex

Disability	Total	Male	Female
Some disability (“some difficulty”)	4.9	4.2	5.5
Severe disability (“a lot of difficulty” and “cannot do at all”)	1.2	1.1	1.3

26. Type and degree of disability by sex (percent)

Type of disability	Total	Male	Female
Difficulty seeing, even if wearing glasses (%)			
Some disability (“some difficulty”)	2.9	2.4	3.4
Severe disability (“a lot of difficulty” and “cannot do at all”)	0.6	0.5	0.7
Difficulty hearing, even if using a hearing aid (%)			
Some disability (“some difficulty”)	2.4	2.0	2.9
Severe disability (“a lot of difficulty” and “cannot do at all”)	0.5	0.4	0.6
Difficulty walking or climbing steps (%)			
Some disability (“some difficulty”)	2.2	1.7	2.6

Severe disability (“a lot of difficulty” and “cannot do at all”)	0.6	0.5	0.7
Difficulty remembering or concentrating (%)			
Some disability (“some difficulty”)	2.3	1.8	2.7
Severe disability (“a lot of difficulty” and “cannot do at all”)	0.6	0.4	0.7
Difficulty with self-care such as washing or dressing (%)			
Some disability (“some difficulty”)	1.8	1.4	2.2
Severe disability (“a lot of difficulty” and “cannot do at all”)	0.5	0.4	0.6
Difficulty with communicating (%)			
Some disability (“some difficulty”)	1.8	1.5	2.2
Severe disability (“a lot of difficulty” and “cannot do at all”)	0.5	0.4	0.6

27. Population aged 5+ years by usual status

Employment status	Total	Male	Female
Labour force participation rate	62.0	65.2	59.0
Employment rate	98.7	98.8	98.5
Unemployment rate	1.4	1.3	1.5
Economically inactive rate	38.0	34.8	41.0

28. Labour force participation rate of population aged 15-59 years by sex and urban, rural

Total/Urban/Rural	Total	Male	Female
Total	81.7	85.8	77.9
Urban	78.0	83.8	72.4
Rural	84.5	87.2	81.9

29. Unemployment rate of population aged 15-59 years by sex and urban, rural

Total/Urban/Rural	Total	Male	Female
Total	1.2	1.1	1.3
Urban	1.6	1.5	1.8
Rural	0.9	0.9	0.9

30. Employment rate by industrial sector and sex

Industrial sector	Total	Male	Female
Primary	54.7	53.0	56.5
Secondary	18.8	18.0	19.7
Tertiary	26.5	29.0	23.8

31. Percentage of migrants by place of last residence and sex

Total/Urban/Rural	Total	Male	Female
Total	21.5	23.1	19.9
Urban	35.3	36.8	34.0
Rural	12.4	14.2	10.7

32. Distribution of internal migrants by migration stream and sex

Migration stream	Total	Male	Female
Rural to rural	29.0	30.7	27.1
Rural to urban	34.0	32.4	35.7
Urban to rural	7.0	7.6	6.3
Urban to urban	30.0	29.3	30.8

33. Distribution of buildings by nature of construction and urban, rural

Nature of construction	Total	Urban	Rural
Permanent	91.1	95.4	88.6
Semi-permanent	7.4	3.8	9.4
Temporary	1.6	0.7	2.0

34. Distribution of households by source of drinking water and urban, rural

Source of drinking water	Total	Urban	Rural
Piped into dwelling	25.5	46.7	12.8
Piped into compound, yard or plot	3.6	4.9	2.9
Public tap / standpipe	3.9	5.7	2.8
Tube well, borehole	25.2	12.9	32.6
Protected well	4.5	2.2	5.9
Unprotected well	5.9	1.4	8.7

CHAPTER 1

Introduction

1.1. Background

The General Population Census of Cambodia 2019 (GPCC) is the fourth census to be carried out in the Kingdom of Cambodia. It is part of the 2020 round of population and housing censuses recommended by the United Nations. The first census in Cambodia was conducted in 1962, with follow-up exercises undertaken in 1998 and 2008. Cambodia continues to use paper-based questionnaires and pencil recording to collect data. As a consequence, extensive work was necessary to prepare the required questionnaires, manuals and training guides; and to carry out a pre-test and pilot census.

Census preparations started in early 2016 with the development of an initial census plan, which was then approved by the Royal Government of Cambodia. A National Census Committee was formed in 2017. A census strategy was also formulated in 2017 and this established that the enumeration would commence on March 3rd 2019. The National Institute of Statistics (NIS) produced the enumeration maps using hand-sketched area plans for the entire country. Each enumeration area was separately delineated.

The previous three censuses had already enabled the Royal Government of Cambodia to build up the capacity required to conduct the 2019 Census. The questionnaire covers population data as well as selected household characteristics. It is hoped that the results from the Census will provide essential demographic and household data for all forms of evaluation and planning.

1.2. Organizational Structure

As in the past, the National Committee for the Census was the lead organizing body. The National Committee was headed by **H.E. Samdech Kralahorm Sar Keng**, Deputy Prime Minister and Minister of the Interior and it included members from all line ministries responsible for policy matters concerning the census. The Census Technical Committee was headed by **H.E. Kitti Settha Pandita Chhay Than**, Senior Minister, Minister of Planning. The Committee was in charge of technical issues relating to the census, such as the design of the questionnaires and training guides, as well as the supervisor and enumerator manuals. The Technical Committee also took the lead in organizing the pilot census and training events, as well as the field enumeration, editing, coding, data entry and the preparation of analytical reports. The Committee for Census Publicity and Advocacy was also led by **H.E. Kitti Settha Pandita Chhay Than**, Senior Minister, Minister of Planning. It provided oversight and advice to ensure that the population was informed through printed publications, television spots, banners, flyers, t-shirts and labelled bags.

The Ministry of Planning was in day-to-day charge of the census operations, with the NIS serving as the implementing agency.

Provincial planning departments acted as provincial census offices during the census operation, with the Director of the provincial departments of planning taking the role of Provincial Census Officer - the senior officer in the province responsible for census operations. Provincial Census Officers were each supported by a specialized assistant. Provincial Census Officers

provided supervision to Census Officers at the district/commune level and also Village Chiefs. The Municipal/Provincial Governors acted as Chair of the Municipal/Provincial Census Committees and these Committees were responsible for oversight of the census operations in their municipality or province. Regional Officers from the National Institute of Statistics were assigned to provide technical assistance to the Provincial Census Officers.

1.3. Publicity for the Census

An information and education campaign was carried out to create public awareness about the 2019 Census and to ensure high levels of cooperation with census enumerators. To obtain truthful answers to sensitive questions like disability, fertility and mortality; experience from previous censuses had shown that it was essential to have strong and widespread publicity at the village level. It was also important for publicity campaigns to emphasize that individual census responses would be kept confidential so as to encourage people to respond confidently to sensitive and personal census questions. Past experience had also indicated that village chiefs play an important role in sensitizing the public about the census.

The success of the census depends, to a large extent, on the attention, guidance and support and cooperation of local authorities at different levels; and on the cooperation of the population. The Census Publicity Committee prepared a strong census publicity campaign with a detailed plan, concrete contents and diverse forms so that all people could hear about the census. The public was informed well in advance about the scope and purpose of the census through different media, with a view to enlisting their cooperation. The publicity campaign commenced with newspaper advertisements and the sensitization of community leaders and others at local meetings. Census publicity reached its peak during the census enumeration phase. As in the last census, it was accomplished not only through different media like radio, television and the press, but also through more conventional methods of communication such as posters, banners, stickers etc.

Physical networks such as those provided by line ministries and religious groups (mainly pagodas) were also utilized. Village chiefs were encouraged to inform the residents of their respective villages about the census and to seek their cooperation.

An in-depth and widespread information campaign for the 2019 Census aimed to:

- Take advantage of the support and assistance of government agencies, mass media agencies and mass organizations to create adequate awareness of the importance and purpose of the census;
- Make the public understand the benefits of the census and confidentiality of responses, so that they are aware of their rights and responsibilities with regard to the census and are willing to cooperate by providing complete and accurate information.

Census advocacy and publicity materials for the 2019 Census were quite diverse and included printed materials, audio-visual materials, and other media. A widespread and in-depth publicity campaign began in December 2018 and became progressively more intense during the census enumeration phase. Daily census news items, news reports, census songs and jingles were broadcast and posted daily at both the central and local levels. Radio, television and newspapers were involved and information was also broadcast on village or neighbourhood loudspeaker systems.

1.4. Questionnaire Content

The results of the last census were disseminated widely among stakeholders and data users. Many policy and development programmes had made use of this information. It was agreed that it would be beneficial if most of the questions were retained for the 2019 Census, so that the results of the two censuses could be compared and progress could be measured on key indicators over time. Census questions aim to gather information about key social indicators and other important outcomes, in order to design follow-up interventions that can serve the interests of the population concerned. From a gender perspective, it is imperative to ensure that there is no sex-selective under-reporting or misreporting in the census. Past experience in Cambodia had found no evidence of a

sex-bias in data collection. A considerable proportion of the 2019 enumeration and supervision staff were women and it was found that their capacity to canvass questions on fertility and maternal mortality was highly satisfactory. The 2019 questionnaire was also designed with a view to obtaining better gender statistics.

The following questions from the 2008 Census of Cambodia are provided here to illustrate the content of the 2019 census questionnaire. There were two questionnaires, House List (Form A) and Household Questionnaire (Form B). The questions had to be answered by the head of household/person concerned/or any responsible member of the household:

Form A: Household identifying characteristics, building/structure number; predominant construction material of walls, roof and floor; purpose of building/structure; household number and characteristics of the head of household; number of persons usually living in the household.

Form B: Full name, relationship to head of household, sex, age, marital status; mother tongue, religion, birth place; previous residence, duration of stay, reason for migration; literacy and full time education; physical/mental disability (if any); main activity, employment period, occupation, employment status, industry, trade or service, sector of employment; detailed fertility information of females aged 15 and over; details of any household member who died within the previous year.

Besides individual information, the following questions on housing conditions and facilities were also collected for regular households: tenure of the dwelling; main source of light, main cooking fuel and presence of a toilet facility within premises; main source of drinking water supply and location of drinking water source; number of rooms occupied by household; ownership of facilities like radio/transistor, television, telephone (landline), cell phone, personal computer, bicycle, motorcycle, car/van, boat, tractor and access to internet.

1.5. Design of the Census Instruments

In its publication “Principles and Recommendations for Population and Housing Censuses, Revision 3”, the United Nations Statistics Division has recommended a list of core topics, topics derived from a core topic, and additional topics for inclusion in population census questionnaires. The NIS developed the questionnaires in accordance with UN recommendations, national needs and past experience; and with the assistance of a census consultant. Instruction manuals for enumerators and supervisors, training guidelines and control forms were also prepared.

These instruments were presented at a stakeholder meeting to elicit the participants views on the questions to be included. Participants were invited to give feedback to ensure that the census would collect data that met international standards and fulfilled the needs of national policymakers and development partners. The draft questionnaires were tested in a pre-test and a pilot census before being submitted for approval by the Census Technical Committee and the National Census Committee. The questionnaire was then completed for every type of household (i.e. regular households, institutional households and the homeless).

1.6. Recruitment of Enumeration Staff

The field enumeration was undertaken with 38,447 enumerators. At the rate of one field supervisor to guide and oversee the work of four enumerators, approximately 9,200 supervisors were also appointed. Enumerators and supervisors were mostly drawn from the ranks of teachers and other public officials. Some students were also deployed as enumerators. However, this was done only after testing their abilities in the field. The fieldwork was implemented under a system of

strict administrative control. A total of 75 Provincial Census Officers, 600 Field Staff Trainers, 400 District Census Officers and 1,700 Commune Census Officers were involved in providing guidance to the enumerators and supervisors in the enumeration areas. The census also deployed an additional 3,500 supervisors and enumerators for so-called “special settlements”, such military facilities, police facilities, prisons, correction centres, orphanages, religious compounds and hard-to-access locations. Selected members of the Ministry of Planning and the NIS participated in training field staff and supervising fieldwork. Provincial, district, commune and village officers assisted in organizing the training sessions and also carried out close supervision of the census count.

H.E. Kitti Settha Pandita Chhay Than, Senior Minister, Ministry of Planning; various secretaries of state and other senior officers of the Ministry of Planning; as well as representatives of development partners and technical advisers, undertook field visits to supervise the census and to encourage the enumerators in their demanding job.

1.7. Training of Census Personnel

The training of census personnel covered operational and field staff at all levels, including supervisors and enumerators. It aimed to establish adequate and uniform census skills across the board. In order to be recruited, enumerators had to meet certain basic criteria. In particular, they were required to have an educational attainment of grade 12 or higher, a strong sense of responsibility and the ability to write numbers and letters legibly. The training of field staff was one of the most important activities prior to undertaking the field enumeration. Technical assistance provided during earlier censuses had significantly strengthened the capacity of the national staff charged with undertaking the 2019 Census. This capacity was further supplemented by additional training. Census technical working teams conducted a 5-day training for 175 Regional Officers, Assistant Regional Officers, Directors and Deputy Directors of municipal/provincial departments of planning. The initial training was delivered from 17th to 21st September 2018 and an additional course for these officials was conducted in October 2018.

Training was also conducted for 600 core trainers. Each of these core trainers was then responsible for conducting two training sessions for supervisors and enumerators on 11th to 14th February 2019 and 18th to 22nd February of 2019. In summary, the training was divided into four levels. The first and second level training was for Census Officers from the NIS, followed by Directors and Deputy Directors of capital/provincial departments of planning. The third level of training was provided to core trainers and was conducted in the provinces where the trainers were deployed. Depending on the size of the province, an average of 25 core trainers were assigned to each province. The fourth level of training was conducted from 11th to 14th and 18th to 22nd February 2019 for supervisors and enumerators in districts nationwide.

1.8. Field Operations

The enumeration process identified around 3.6 million regular households located across the 25 capital/provinces of Cambodia. The preparatory household listing process (Form A) was carried out from 28th February to 2nd of March 2019. The actual enumeration (Form B) started on 3rd March at midnight and lasted until 13th March 2019. As already mentioned, the census deployed around 40,000 enumerators and about 10,000 supervisors to collect data in a total of 14,545 villages. There were a little more than 38,447 regular enumeration areas, with the remainder of the staff assigned to special settlements such as camps, prisons and hospitals. Homeless persons (including those staying on boats) were enumerated by 3,500 special enumerators on 3rd of March during the night.

In keeping with the 13th March 2019 deadline, most households in Cambodia were interviewed during the eleven-day enumeration period. However, recent growth in the Chinese population in Preah Sihanouk meant that it was necessary to extend the enumeration period in this province by three days. A special team from the NIS was also deployed to support the Preah Sihanouk team with the enumeration. The existence of many new households in Phnom Penh also resulted in an extension of the enumeration period in the capital, with interviews carried out until 20th of March 2019.

Enumerators and other census officers travelled long distances to reach remote and forested areas. The field staff used vehicles, motorcycles, bicycles and boats. Mobile phone communication was highly useful during the census fieldwork and ensured that supervisors and enumerators were able to contact core staff when assistance was needed.

Timetable of Major Census Fieldwork

Date	Activities
February 28 th to March 2 nd , 2019 (3 days)	Household listing in enumeration areas and updating the enumeration area maps
March 3 rd , 2019 night-time	Enumeration of the homeless and transient population
March 3 rd to 13 th , 2019 (11 days)	2019 Census enumeration with midnight of March 3 rd (00:00 AM) chosen as the reference moment
March 13 th to 14 th , 2019	Collection of completed census documents from field offices
March 15 th to 22 nd , 2019	Receipt of completed census records at the NIS in Phnom Penh

1.9. Storage Management

Storage management is an important part of census operations. Completed questionnaire batches, bundled by enumeration area, were received and stored in storage rooms organized by administrative area. The reception of each enumeration area batch was recorded in a computerized file. This file was also used at a later stage when enumeration batches temporarily left the storerooms for processing purposes. A data processing officer was responsible for recording all of these transactions. Paper forms were used to accompany each enumeration area batch as it travelled through the processing chain.

1.10. Quality Assurance

Clear steps were taken to ensure data quality at each stage of the census. For quality assurance in fieldwork, training classes for enumerators and supervisors stressed the importance of collecting accurate and detailed information during interviews. The need to collect accurate data by gender was also emphasized. For every four enumerators, there was a field supervisor who closely checked the work of each enumerator. The data processing division initially carried out manual coding and editing of filled-in schedules. Computer editing was also carried out to produce clean datasets that were free from errors and ready for tabulation. Quality assurance processes also sought

to ensure that the census priority tables were reliable and produced in a timely manner. The dissemination of census results prioritised accessibility, relevance and user satisfaction.

The Census Technical Committee designed and endorsed clear legal procedures aimed at ensuring the quality of census data. This included requiring supervisors to enumerate some households independently and to then match them with the enumerator's records. The results were recorded in a separate form and any deviations were used to help improve the skills of the enumerators. In the event of any serious discrepancies, enumerators were given additional training. To summarize, monitoring and census quality assurance were assisted by implementing the pilot census; duplicating some interviews during the enumeration; close supervision by supervisors and their superiors; quality control during the data processing stages; and conducting a post-enumeration survey.

1.11. Editing, Coding and Software

1.11.1 .Editing and Coding

The objective of editing and coding is to maximize the quality of the data by detecting errors on questionnaires and making suitable imputations. An imputation is an alteration of incorrect or missing data that uses contextual clues to provide a best guess as to what a correct value may be. Most errors that are detected are due to mistakes made during fieldwork. During an interview, a respondent might not know the answer to a certain question. For example, some people might not know their exact age. Other respondents might not have fully understood a particular question and, as a consequence, they provide the enumerator with a wrong answer. In other cases, the respondent might not be willing to answer a certain question. Finally, the enumerator might also contribute to the errors by failing to record a respondent's answers correctly. For the 2019 Census, training on editing and coding of filled-in schedules was conducted for senior staff, who then trained other editors and coders. The purpose of the editing process was to remove matters of obvious inconsistency, incorrectness and incompleteness. It also sought to improve the quality of the data collected.

Besides editing the questionnaires, this work also included coding some variables. During fieldwork, the responses to most questions on Form B were recorded with numeric codes. However, some answers were recorded in a descriptive manner. These questions included: birthplace, previous residence, main subject of study, occupation, industry and place of work or schooling. Coders were responsible for assigning the correct numeric codes to these descriptive answers and a census coding manual provided guidance to help coders choose the right code for each of these variables.

The editing and coding process involved 150 staff and was initially scheduled to be completed around January 2020. However, this process took slightly longer than planned and, to minimise delays, the National Institute of Statistics requested additional officials from other units within the Ministry of Planning. With the assistance of these extra technical officers and management staff, the editing and coding process was completed by the end of June 2020. Once the editing and coding was completed, the census questionnaires were transferred over to the data entry team.

1.11.2. Software and Data Capture

In order to capture the data recorded on Form A (House List) and Form B (Household Questionnaire) two separate data entry applications were made using the CSPro software package.

CSPro was also used for tabulations. The data entry team consisted of 100 keyboard operators working under 10 supervisors. Approximately one week after the editing and coding process started, data entry staff were given a thorough training on data entry procedures and the CSPro data entry software. Due to the network connection, data entry started about a month and half after the editing and coding process. The data entry was estimated to be completed within nine months but was ultimately delayed by the COVID 19 pandemic. To minimise delays, the NIS recruited around 200 students from Phnom Penh University. These additional recruits helped to accelerate data entry activities by working a half-day and a full day on Saturday and Sunday. As a result, data entry was completed by the end of June 2020.

1.12. Tabulation Plan

The analysis of census data by the NIS is mainly confined to priority tables and tables produced for specific purposes. However, census analysis is not confined to the government. Universities, scholars, demographers, institutions and data users can also use and analyse the data in accordance with their own needs and interests. Going forward, these users will be encouraged to contact the census Data Users Service Centre (DUSC) for any additional information, tables or reports. There is considerable scope for additional analyses using the data, with census tables and microdata permitting a wide range of potential cross-classifications and tabulations.

Priority tables are usually the most basic publication arising from a census. All the census variables and relevant cross-tabulations are presented in tabular form. This is particularly important for the calculation of demographic and socio-economic indicators for planning and policy making. Most of the priority tables from the 2019 Census were produced for national and key sub-national levels. The tables were produced following the completion of the data cleaning process.

The number of priority tables is similar to the 2008 Census. The tables cover almost all of the sections in the census questionnaire and organise the data across all areas relevant for data users. For more in-depth analyses, supplementary user-requested data and other data tables will be created.

1.13. Post Enumeration Survey (PES)

The General Population Census of Cambodia 2019 was conducted to enumerate people at the place where they were staying on census night i.e. the place where they were located at midnight on Sunday March 3rd 2019. The Post Enumeration Survey (PES) intended to assess how well people were counted by the Census. The PES was conducted soon after the Census in selected areas. The PES intended to estimate error in the census count and in the information that was collected. Some error is inevitable in a large-scale operation like a census. The first visit to households by PES enumerators was used to carry out a re-count, which was then followed by desk matching with census records at the office. A second visit to households was then carried out to reconcile any discrepancies. The sample that was selected, consisted of 130 enumeration areas. The selected enumeration areas were re-enumerated for the PES. The overall size of the PES sample that was selected was about 12,500 households, with a de facto population of around 60,000 persons. The national population undercount was 2.5 percent or 396,587. The percentage undercount in Phnom Penh was higher than in the provinces, with 6.3 percent or 141, 985 in the capital, versus 1.9 percent or 354, 602 in the provinces. The overall population in the country on March 3rd 2019 was estimated at 15,685,076, with 2,271,356 in Phnom Penh. In general, the aggregate index of inconsistency is considered low if it is less than 20 percent, which is the case for

Cambodia. Judging from the net coverage error of missed persons and the level of response variance of selected characteristics estimated by the PES, the results of the 2019 General Population Census of Cambodia are of sound quality. The results of the Post Enumeration Survey are available as a report from National Institute of Statistics.

1.14. Urban Reclassification

The 2020 reclassification of urban areas in Cambodia was undertaken by the NIS in June-July 2020 using the final dataset from General Population Census of Cambodia 2019. The urban reclassification involved a comprehensive field study, which was carried out by NIS with guidance from experts and relevant agencies. The study attempted to provide recommendations about a classification of urban places based on a consistent set of criteria that included population size, population density and numbers of agricultural workers. After careful consideration of all relevant aspects, the study recommended applying the following criteria to every commune so as to treat it as urban:

1. Economic and demographic aspects

- Total population of the commune in excess of 2,000.
- Population density in excess of 200 per km²
- Percentage of employment in non-agricultural occupations in excess of 50 percent

2. Statutory administrative aspects

Towns identified on the basis of statutory administration or recognized by decrees and laws. The first category of urban units is known as statutory towns. These towns are recognised by the relevant government by law and have local bodies like municipalities/krongs, irrespective of their demographic characteristics.

3. Field visit and consultation

After careful consideration of all aspects highlighted by the field study, staff from the National Institute of Statistics inspected the actual situation of the communes classified as urban on the basis of these criteria and participated in consultation with the sub-national authorities and associated chairpersons. The provincial departments of planning, the Ministry of Land Management, Urban Planning and Construction, the Ministry of Interior, UNICEF, UNFPA and UNHABITAT were all involved in this process.

The study's recommendations were accepted by the Royal Government of Cambodia, and subsequently adopted for the 2019 Census. Details of this study are provided in the NIS/Ministry of planning report, "Reclassification of Urban Areas in Cambodia 2020".

1.15. Analysis and Report Writing

The main objective of the 2019 Census is to provide results and analyses that can be used to inform development planning. Censuses provide benchmark data which can be used by agencies working in different areas like reproductive health and family planning services, education and training, research, population and development, women and gender. The government aims to develop an integrated population information system, which can be used to monitor population programmes. It is planned that data from the 2019 Census will be disseminated through publications and electronic media. NIS staff have been given specialised training in data analysis and it is expected that these staff will undertake specific

analyses of the data with additional support from consultants. A series of thematic reports on the 2019 Census, each dealing with a specific topic, will be published after the initial analysis.

- a. **Preliminary 2019 Census results:** initial results based on population totals obtained from the field. These results were analysed and released in August 2019.
- b. **2019 Census final report:** national-level results, as well as some selected tables, data and brief notes for each province.
- c. **2019 Census final provincial-level results:** a report for each of the 25 provinces, following the broad template set out in this national-level report. The results will be drafted by the NIS staff trained in data analysis.
- d. **Thematic reports:** a series of in-depth reports focusing on various topics key covered by the 2019 Census. These reports go beyond the tables and graphs presented in the initial census products. The thematic reports will include demographic and statistical analyses of the data and will provide an interpretation of the data that draws on appropriate conceptual frameworks and is oriented towards future development planning and policies.

The topics proposed for thematic papers based on the 2019 Census are:

1. Fertility and nuptiality
2. Mortality and maternal mortality
3. International and internal migration
4. Population projections
5. Population distribution and urbanization
6. Population growth and composition by age and sex
7. Disability
8. Literacy and educational attainment
9. Economic activity and employment
10. Ageing and living conditions
11. Gender Dimension
12. Households, housing conditions and amenities
13. Ethnic minorities
14. Provincial reports (one for each province)
15. Water, sanitation and hygiene
16. Situation of children and youth
17. Census atlas

1.16. Dissemination Plan

The findings of the previous census data were successfully disseminated through electronic products and printed reports and by way of dissemination seminars and workshops at the national and provincial levels. The CDs released each for priority table were well received and used by the line ministries, international agencies, NGOs, provincial planning offices, districts and communes, universities, individual and institutional scholars and researchers, teachers and students, and other data users. Another important dissemination product developed was a website with census background information, key census results and a request page so that remote data users could demand more detailed census information. Specialised census tables were also occasionally

supplied in response to requests from data users. The Data Users Service Centre (DUSC) has also been providing support to data users on an on-going basis.

1.16.1. Offline Dissemination

Seminars for the presentation of census results to line ministries and other data users will be conducted at the end of 2020. Such seminars/workshops will be held in every province to benefit participants and specific provincial reports will also be published. The purpose of the dissemination workshops is to provide census data to planners, administrators and researchers working at the provincial, district and commune-levels. It is hoped that these direct interactions between the census data producers and users will help users to better understand the impact of population growth on welfare measures undertaken by the government. The census data will also help users to monitor the progress being made in relation to the various development programmes currently ongoing in Cambodia.

1.16.2. Online Dissemination

The National Institute of Statistics maintains a website (www.nis.gov.kh) with information on population censuses, the results of various types of surveys, periodicals and publications. Most of the information available on this website is in a static format. For the online dissemination of the results of the General Population Census of Cambodia 2019, a more dynamic approach is envisaged. It is planned that priority tables and analysis outputs will be made available online to provide greater access to the data remotely. This might also be extended to include SQL database querying and on-line mapping. In all instances, security, authentication, recoding and aggregation shall be prioritised in order to abide by the confidentiality provisions enshrined in national legislation relating to statistics.

1.17. Census Products

Just like the previous censuses, the following products are planned to be produced for the 2019 census to ensure wider dissemination and utilization of the census products:

- a) **Priority tables.** The Priority Tables Report is usually a printed publication that contains a set of basic tables. This is the simplest publication in the sense that it should present tables of all census variables, which are relevant to calculate demographic and socio-economic indicators, as well as other variables that are specifically relevant to planning and policymaking. Most tables refer to the national level and only a few relate to the main administrative subdivisions.
- b) **Printed products.** In most countries, paper publications remain the preferred choice for the dissemination of the main census results. At least for the present, printed reports tend to reach to the largest number of potential census users. Paper media do not require that the user have any particular equipment, software or technical skills. The following products will be disseminated as printed publications: *Priority Tables*, *Final Census Report*, *Analysis of Final Census Results at the Provincial Level*, *census posters*, *census brochures*, *thematic papers* and the *Census Atlas*.
- c) **Static electronic publications.** Electronic versions of the aforementioned printed publications (i.e. .pdf and .doc formats)

- d) **Dynamic macrodata products.** Drawing on geography, subject matter and/or title, these products retrieve and display tables, maps and other previously prepared documents from a large database of documents. This is a very useful data dissemination tool. The dissemination tool DEVINFO was used to disseminate the data of the 2008 Census and other surveys (under the name CAMINFO). The Table Retrieval tool in CSPro is another example of a dynamic macrodata product.
- e) **Dynamic microdata products.** Allow the access to individual or household data. Examples are SPSS, SAS, and several other statistical programs for data analysis. The main problem of disseminating microdata is confidentiality. When individuals agree to respond to the census questionnaire, they do so on the understanding that their responses will be anonymised and will be used to produce aggregated statistics. Like most statistical offices, the NIS is bound by law to protect census microdata and to keep these data confidential. Providing access to census microdata at the individual or household level risks breaching this confidentiality. REDATAM is a software package that solves this problem. Data are stored in internal (encrypted) format that does not allow users to access individual or household records but nonetheless enables the data to be processed at the individual level. In addition, the level of geographical access can be defined by the statistical office. In other words, REDATAM allows users to produce any table (as opposed to downloading tables) at different geographical or administrative levels. In addition to tables, REDATAM can also produce graphs and maps. Aggregate results can be exported to other software (ASCII, EXCEL, GIS) and dissemination of this application can be done on CDs, DVDs, or flash drives. It also has the capacity to provide on-line data processing.

CHAPTER 2

Population Size, Growth and Distribution

2.1. Population Size

The final results of the General Population Census of Cambodia of 2019 (GPCC) show that the total de facto population of Cambodia on March 3rd, 2019 stood at 15,552,211. This is the population that spent the night at the place of enumeration, thereby excluding those who were abroad. The total de facto population increased from a total of 13,395,682, which was recorded in the 2008 Census. Thus, the population has grown by 2,156,529 persons, which represents 16.1 percent, over the 11-year period from 2008 to 2019. The male population was 7,571,837 (48.7 percent), while the female population stood at 7,980,374 (51.3 percent).

The first Cambodian census was conducted in 1962, following independence from France. It counted a total population of 5.7 million. The demographic situation of the nation changed dramatically after this first census because of war and civil unrest. The country carried out no further census until 1998. However, demographers did make some population estimates to serve as the base population for planning and policy development. A demographic survey conducted in 1979-1980 estimated the total Cambodian population at approximately 6.6 million. In 1994, the Cambodian Socio-Economic Survey was carried out by the National Institute of Statistics (NIS). The Survey estimated the total population of Cambodia at 9.9 million. In March 1996, the NIS conducted another demographic survey covering 20,000 households, which estimated the total population of Cambodia at 10.7 million. The 1998 Census recorded a population of 11.4 million. The NIS also undertook an Inter-Censal Survey in 2004 and found that the population had increased to 12.8 million. Following a pattern of steady increase, the 2008 Census obtained a result of 13.4 million. The Inter-Censal Survey in 2013 revealed a population of 14.7 million and the final result of GPCC 2019 accounted for 15.6 million.

Figure 2.1.1. Cambodian total population in millions, 1962-2019*

**Note: These figures exclude migrants working abroad. According to the Report of Annual General Meeting 2018, Ministry of Labour and Vocational Training, the destination countries were: Thailand: 1,146,685, Republic of Korea: 49,095, Japan: 9,195, Malaysia: 30,113, Singapore: 831, Hong Kong: 45 and Saudi Arabia: 16.*

The urban population of Cambodia stood at 2,614,027 in 2008 and increased to 6,135,194 in 2019. On the other hand, the rural population of the country declined from 10,781,655 in 2008 to 9,417,017 in 2019. The urban population as a percentage of the total population - one of the key measures of urbanization - has increased from 19.5 percent in 2008 to 39.4 percent in 2019.

Disaggregating the total population into the four regions in table 2.1.1 shows that the Central Plain region was the most highly populated, comprising 7,644,295 persons or 49.2 % of the total population. The Tonle Sap region was the second most populated region, with 4,852,964 persons or 31.2% of the total. The Plateau and Mountains region was the third most populous area with 1,982,484 persons or 12.7%. And finally, the Coastal and Sea region had a population of 1,072,468 or 6.9 % of the total.

Figure 2.1.2. Distribution of total population by province, Cambodia, 2019

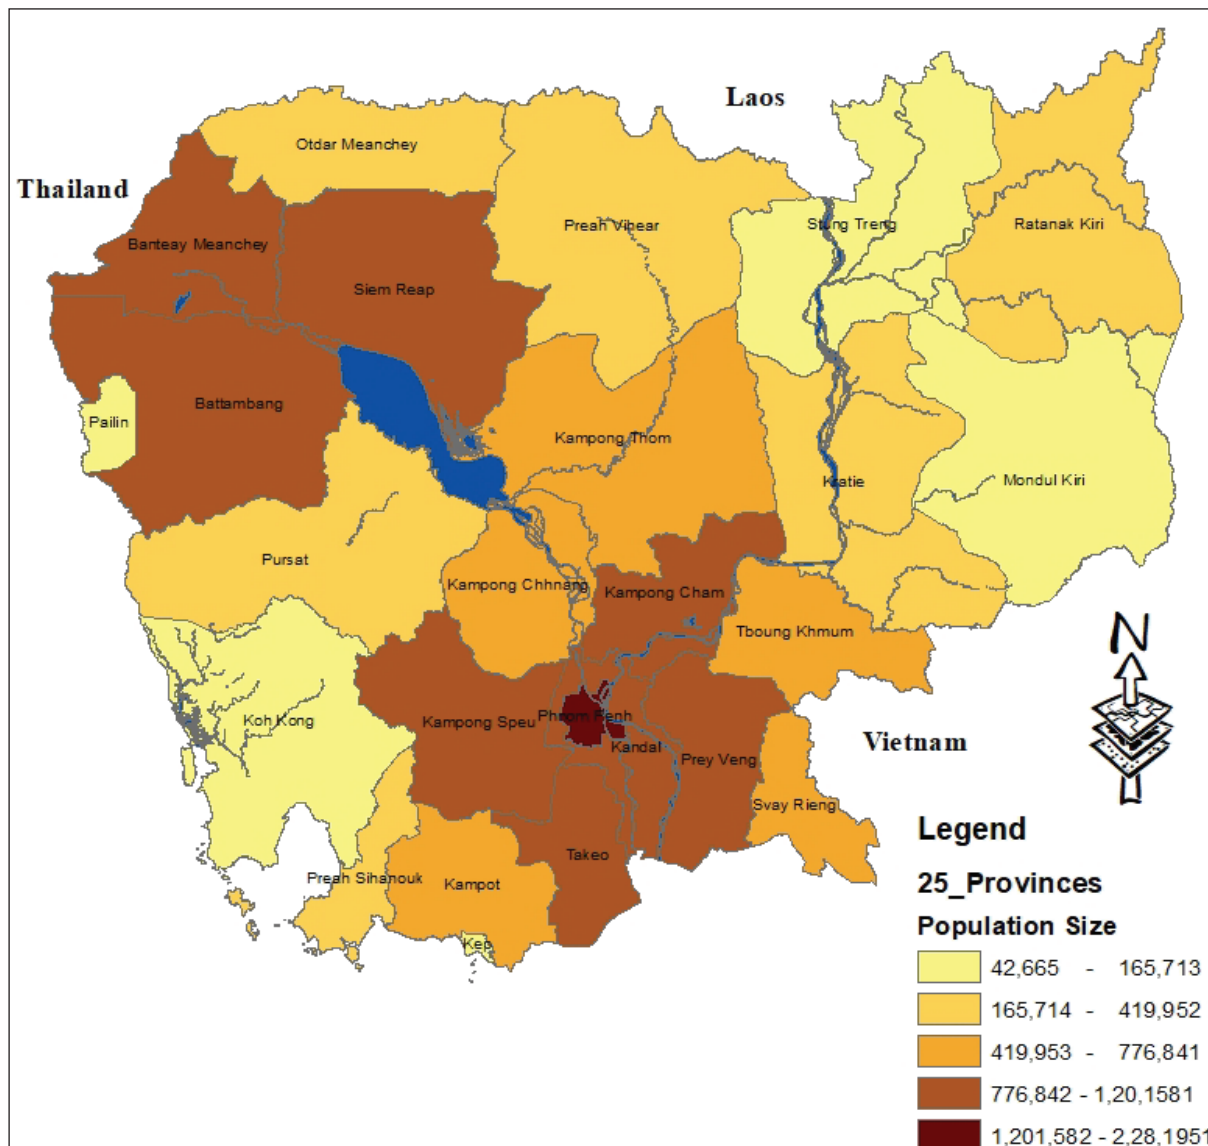

At the provincial level, Phnom Penh had the highest population with 2,281,951 (14.7 %), followed by neighbouring Kandal with a population of 1,201,581 (7.7%); Prey Veng, 1,057,720 (6.8%); Siem Reap, 1,014,234 (6.5%); Battambang, 997,169 (6.4%); Takeo, 900,914 (5.8%); and Kampong Cham, 899,791 (5.8%). Kep was the province with the lowest population at 42,665 (0.3%).

Table 2.1.1. Distribution of total population by area, region, province and sex, Cambodia, 2019*

Area/Region/Province	Male	Female	Total
(1)	(2)	(3)	(4)
Total	7,571,837	7,980,374	15,552,211
Urban	2,993,339	3,141,855	6,135,194
Rural	4,578,498	4,838,519	9,417,017
Central Plain	3,676,211	3,968,084	7,644,295
Tonle Sap	2,380,256	2,472,708	4,852,964
Coastal and Sea	533,560	538,908	1,072,468
Plateau and Mountains	981,810	1,000,674	1,982,484
Banteay Meanchey	427,945	433,938	861,883
Battambang	490,424	506,745	997,169
Kampong Cham	431,327	468,464	899,791
Kampong Chhnang	252,185	274,842	527,027
Kampong Speu	425,102	452,421	877,523
Kampong Thom	330,602	350,947	681,549
Kampot	287,590	306,239	593,829
Kandal	581,563	620,018	1,201,581
Koh Kong	63,444	62,458	125,902
Kratie	186,658	188,097	374,755
Mondul Kiri	47,242	44,971	92,213
Phnom Penh	1,105,673	1,176,278	2,281,951
Preah Vihear	128,436	126,391	254,827
Prey Veng	498,711	559,009	1,057,720
Pursat	204,172	215,780	419,952
Ratanak Kiri	109,978	107,475	217,453
Siem Reap	497,450	516,784	1,014,234
Preah Sihanouk	161,462	148,610	310,072
Stung Treng	84,394	81,319	165,713
Svay Rieng	249,581	275,916	525,497
Takeo	431,266	469,648	900,914
Otdar Meanchey	139,378	136,660	276,038
Kep	21,064	21,601	42,665
Pailin	38,100	37,012	75,112
Tbong Khmum	378,090	398,751	776,841

*Note: These figures exclude migrants working abroad.

Map 2.1.1. Distribution of total population by province, Cambodia, 2019

2.2. Annual Growth Rate

The annual growth rate is an important indicator to determine variations in the population of a country or region over a period of time, regardless of whether the change is positive or negative. Changes in population size are usually measured as a percentage of the base population.

The final results from the GPCC 2019 indicate that the de facto population of Cambodia increased by 2,156,529 persons over the 11-year period between 2008 and 2019. This represents an increase of 16.1 percent. The average annual growth rate over this period was registered at 1.4 percent. The growth rate has dropped dramatically due to a decline in fertility and out-migration, especially to neighbouring countries.

The highest annual growth rate of 2.4 percent was found in the Plateau and Mountains region, an area that mainly covers provinces which are situated in the north-east. This was followed by the Central Plain region with an annual growth rate of 1.4 percent. In the Coastal and Sea region and the Tonle Sap region, the annual growth rate was only 1.0 percent. Compared to the previous decade, the annual growth rate increased slightly for the Coastal and Sea region (0.8 percent to 1.0

percent) and for the Plateau and Mountains region (2.2 percent to 2.4 percent). For the Tonle Sap region the annual growth rate declined markedly.

At the provincial level, the final results of the 2019 Census show a high annual growth rate (i.e. more than 3.0 percent) in Phnom Penh (4.9 percent) followed by Mondul Kiri (3.7 percent); Otdar Meanchey (3.6 percent), Preah Vihear (3.6 percent) and Stung Treng (3.6 percent); Ratanak Kiri (3.3 percent) and Preah Sihanouk (3.1 percent), Banteay Meanchey (2.2 percent) These provinces have a relatively high fertility rate and have absorbed migrants from other provinces. This is likely due to developing agricultural and other economic activities in these areas. Phnom Penh and Preah Sihanouk have absorbed many migrants, especially younger people from other provinces. In particular, these provinces are characterized by a lot of employment opportunities, economic activity, tourism and educational opportunities. The total population increased for most of the provinces, except for Kampong Cham, Battambang and Kandal, which are characterized by a negative growth rate.

When compared to the years 1998-2008, the annual growth rate has declined to some extent in many provinces. However, Phnom Penh, Koh Kong, Banteay Meanchey, Prey Veng, Preah Sihanouk, Stung Treng and Svay Rieng have increased.

Table 2.2.1. Annual growth rate by area, region, and province, Cambodia, 2008-2019*

Area/Region/Province	Total Population		Annual Growth Rate	
	2008	2019	1998-2008	2008-2019

**Note: These figures exclude migrants working abroad.*

Map 2.2.1. Annual population growth rate, 2008-2019

2.3. Population Distribution

Table 2.3.1 shows the relative share of the de-facto population by area, region, province, and sex. The GPCC 2019 revealed that the Cambodian population continues to live mostly in the Central Plain region, which comprised 7,644,295 persons which constitute 49.2 percent of the total population. The Tonle Sap region is the second most populated region with 4,852,964 persons or 31.2 percent of the total. The Plateau and Mountains region is the third most populous area, comprising 1,982,484 persons or 12.7 percent of the total. And finally, the Coastal and Sea region has a population of 1,072,468 which equals 6.9 percent. The pattern of distribution did not change dramatically between 2008 and 2019. The share of the population increased slightly in the Plateau and Mountains region. This is probably due to new settlements and improving employment. The percentage of the population in the Tonle Sap region (i.e. the provinces surrounding the Tonle Sap lake and along the border with Thailand) declined. This is possibly because of out-migration, particularly to neighbouring countries. The Coastal and Sea region has also declined slightly overall.

Table 2.3.1 presents the changes in the de facto population by provinces-municipalities and sex over the years 2008-2019. The final results show that the municipality of Phnom Penh still had the highest fraction at 14.7 percent, followed by Kandal with 7.7 percent. Prey Veng comes in at 6.8 percent, then Siem Reap with 6.5 percent and Battambang with 6.4 percent. Other large provinces in terms of population are Takeo with 5.8 percent and Kampong Cham with 5.8 percent. Finally, Kep had the lowest share, with only 0.3 percent.

Compared to 2008, the distribution of the population within Cambodia did not change dramatically in 2019. The share of the national de facto population declined slightly in 13 provinces: Kandal, Prey Veng, Siem Reap, Battambang, Kampong Cham, Kampong Chhnang, Kampong Thom, Kampot, Koh Kong, Pursat, Svay Rieng, Takeo and Tbong Khmum. The rest of the provinces increased their share of the country's population. The share taken by Kep and Pailin remained stable over time. However, Preah Sihanouk showed considerable relative growth.

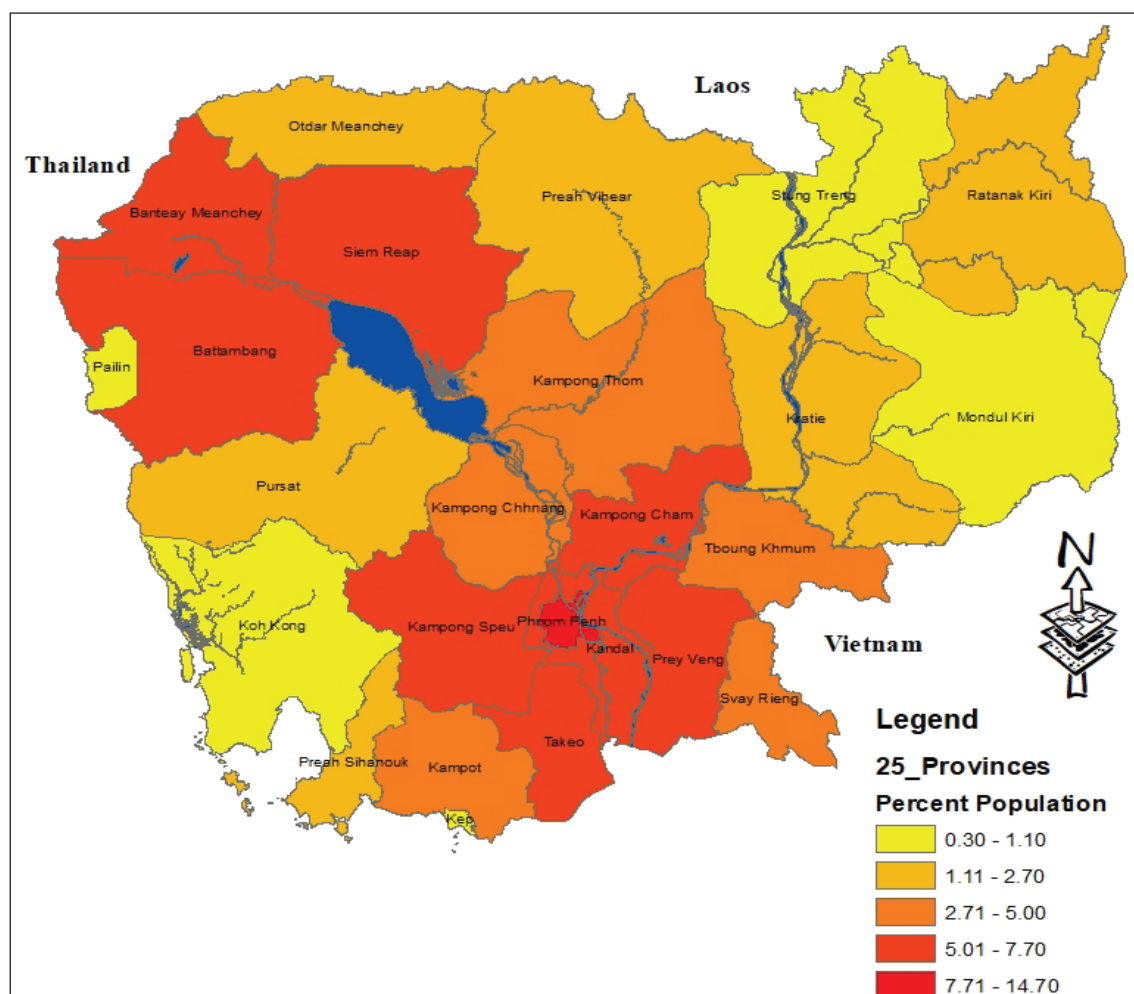

Table 2.3.1. Distribution of population by area, region, province and sex, 2008-2019*

Map 2.3.1. Percentage distribution of the total population by province, Cambodia 2019

2.4. Population Density

Population density is an indicator of the concentration of the population in certain areas. It is usually defined as the number of persons per square kilometre (km²). Results from the GPCC 2019 show that the population density of Cambodia was 87 persons per km². This is an increase of 12 persons, compared to the 75 persons per km² recorded in 2008.

The population density by region in 2008 and 2019 revealed that the population density varied widely in the Kingdom. In the Central Plain region, the population density was relatively high at 305 persons per km², followed by the Tonle Sap region where the population density was 72 persons per km². The Coastal and Sea region followed with a density of 62 persons per km², while the Plateau and Mountains region had the lowest density at only 29 persons per km².

Compared to 2008, the population density in the Central Plain region increased from 261 to 305 persons per km², an increase of 44 persons per km². In the Tonle Sap region, the population density grew by 15 persons per km². In the two regions, the population density has increased by 6 (Coastal Sea) and 7 persons (Plateau and Mountains) per km² respectively. The Plateau and Mountains region remained the lowest in terms of population density.

Table 2.4.1 shows the population density by province in 2008 and 2019. Phnom Penh - the nation's capital and the centre of economic, social, and cultural activity - continued to attract people from other provinces. Employment and growth in the garment, construction, tourism and educational sectors are particularly attractive "pull factors" that are exerted by the capital. Phnom Penh has the highest population density at 3,361 persons per km², followed by Kandal, Takeo, Prey Veng, Kampong Cham, Svay Rieng, and Preah Sihanouk with at least 150 persons per km². Koh Kong (12 persons per km²) and Mondul Kiri (6 persons per km²) provinces had the lowest population density per km². Compared to 2008, the population density had increased in nearly all provinces in 2019. This increase is due to population growth.

Table 2.4.1. Population density by area, region, and province, Cambodia, 2008-2019*

Area/Region/Province	Total population		Area (km ²)	Population/km ²	
	2008	2019		2008	2019

Tbong Khmum	754,000	776,841	5,250	144	148

**Note: These figures exclude migrants working abroad.*

***Note: The population density is calculated excluding the total area of Tonle Sap lake (3,000 km²).*

Map 2.4.1. Population density by province, Cambodia, 2019

2.5. Population and religion

The predominant religion in Cambodia is Buddhism (97 percent), followed by Muslim (2 percent) and other religions (0.8 percent). The category of “Others” mainly refers to the local religious system of the highland tribal groups and a few minority religious groups from other countries. The distribution of the population by religion was more or less the same in 2008 and 2019.

Table 2.5.1. Percentage distribution of population by religion, area, and province, Cambodia, 2008-2019*

Area/Province	2008				2019

**Note: These figures exclude migrants working abroad.*

Note: The sum of the four religion categories amounts to 100 percent.

2.6. Population and Place of Birth

A common pattern that is evident in the 2008 and 2019 Censuses, is that a large majority (78.3 percent) of those enumerated on the Census night were also born at the place of enumeration (table 2.6.1). Lifetime migrants (persons who are not living in their place of birth) therefore constitute only 21.7 percent of the population at the national level.

Table 2.6.1. Distribution of population by place of birth and sex, Cambodia, 2008-2019*

Place of Birth	2008			2019		
	Both Sexes	Male	Female	Both Sexes	Male	Female
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Number	13,395,682	6,516,054	6,879,628	15,552,211	7,571,837	7,980,374
Percent	100	100	100	100	100	100
A. Born in Cambodia	99.4	99.4	99.3	99.1	99.0	99.3

2. Other Countries	0.03	0.04	0.02	0.04	0.06	0.03

*Note: These figures exclude migrants working abroad.

2.7. Population and Mother Tongue

The question on mother tongue was collected from all persons in the census households. The information presented in table 2.7.1 shows that Khmer was the predominant mother tongue in the country (95.8 percent) in 2019. Ethnic minority languages constituted 2.9 percent. 1.3 percent were people with a foreign language as mother tongue.

Table 2.7.1 Distribution of population by mother tongue and sex, Cambodia, 2019*

Mother Tongue	Population			Percentage		
	Total	Male	Female	Total	Male	Female
(1)	(2)	(3)	(4)	(5)	(6)	(7)

CHAPTER 3

Age Structure, Sex Composition and Marital Status

3.1 .Conceptual Background

Ongoing changes in the size and age structure of populations, at various levels of geographic aggregation, are occurring in most countries of the world. These changes are mostly a function of a decline in mortality followed by a decline in fertility. The age and sex structure of a population is determined by past and current trends in fertility, mortality and migration. Population structure has an important influence on the social, economic and political conditions in a country. Changes in the age and sex structure can have far reaching consequences for a country's work force, economic prospects, public and personal budgets, security risks, cultural organizations and family structures.

Age is such an important population characteristic that almost all planning for development must take it into account. The link between the age-sex structure and government policies is illustrated by the following example. Many countries in the developing world, like Cambodia, have policies to develop human resources and the economy by promoting school enrolment and improving the quality of education. In order to successfully implement these policies, projections of the school-age population at all administrative levels are made on the basis of the age-sex distribution of the population that is obtained from the census. These projections enable planners to estimate the required number of educational institutions in the various parts of the country, as well as the number of buildings, teachers and other infrastructure.

According to the definition laid down by the United Nations, a person's age is recorded in a census as "the interval of time between the date of birth and the date of the census, expressed in completed solar years" (United Nations, 2008). It is also recommended that age information may be obtained by recording the date (year, month and day) of birth or by asking directly for age at the respondent's last birthday.

These age data recommendations have been followed in all past and present censuses in Cambodia. Information on age in completed years at last birthday was obtained from the respondents to the General Population Census of Cambodia 2019 (GPCC). Although it is easy enough to ask questions about age, it can be difficult to obtain correct age information when people are not literate or when they are very old. Suitable steps were taken to collect accurate information on age from every respondent. The Khmer calendar was used by the enumerators in a number of cases in order to elicit the completed age from respondents who had trouble reporting their age. The enumerators were also given a list of events of national and local importance, to help the respondents to accurately recall their age.

3.2. Evaluation of Age Data

Despite the care taken in the field to obtain accurate ages, it is possible that the data still contain some errors. As a consequence, it is necessary to evaluate them before they are used. The following standard demographic indices were calculated for this purpose with respect to the age-sex data used in the GPCC 2019.

Table 3.2.1. Age and sex data evaluation, Cambodia, 2019

Sex	Myer's Index	Whipple's Index	
		Age Ending in 0	Age Ending in 5
Both Sexes	3.3	106	113
Male	3.3	104	113
Female	3.3	108	113
United Nations Age-Sex Accuracy Index			32.0

Myer's Index

This index is a measure of heaping on individual ages or terminal digits. The tendency to record or report certain ages in lieu of others is referred to as age heaping, age preference or digit preference. The theoretical range of Myer's index (on a 0 to 180 scale) extends from the minimum of "0", when there is neither preference nor avoidance of any particular digit at all, to a maximum of 180 when all ages are reported in a single terminal digit. Myer's index from the 2019 Census is calculated as 3.3 for both sexes. Hence, the incidence of age heaping is well within the limit.

Whipple's Index

The age returns were also tested for digit preference and age heaping in terminal digits. Whipple indices were calculated for this purpose. Whipple's index is a measure of preference for ages ending in 0 and 5. Its range is from 100, indicating no preference for 0 and 5, up to 500 indicating that only 0 and 5 were reported. Whipple's index for the GPCC 2019 was recorded as 106 for preference for the digit zero, indicating that there was almost no preference for "0". The index is 113 for preference for the digit five, indicating also that there was almost no preference for the digit "5" in the GPCC 2019. It is therefore clear that the collected information on age is free from digit preference.

United Nations Age-Sex Accuracy Index

The United Nations has developed an age-sex accuracy index in which the mean of the differences from age to age in reported sex ratios, without regard to sign, is taken as a measure of the accuracy of the observed sex ratios. It is assumed that these age to age changes should approximate to zero. The UN Age-Sex Accuracy Index combines the sum of, (i) the mean deviation of the age ratio for males from 100, (ii) the mean deviation of the age ratios for females from 100 and (iii) three times the mean of the age to age differences in reported sex ratios. For this purpose, the age ratio is defined as the ratio of the population in a given age group to one half of the sum of the populations in the preceding, and the following, age groups.

Adopting this procedure, the UN Age-Sex Accuracy Index for Cambodia was calculated as 32.0. An index of 20 or less is considered as indicative of accurate age-sex data. It should be pointed out that this method does not take into account any decline in the sex ratio with increasing age; real irregularities in age distribution due to migration, war, etc.; as well as normal fluctuations in births. Since all of these factors affect the age-sex data in the GPCC 2019, the index is likely to exceed 20. On the basis of the above tests it may be concluded that, the age data collected from the GPCC 2019 may be considered as fairly reliable, albeit with some irregularities.

3.3. Age Structure

The age structure of a population is determined by the same three factors which affect the growth rate of any population: fertility, mortality and migration. To study the age structure of the population we make use of the percentage distribution of the population in different age groups, as well as the graphical representation of this, which is called the “age pyramid”. This roughly summarizes the demographic history of the population.

Table 3.3.1. Distribution of population by single age, sex and area, Cambodia, 2019

Single Age	Total			Urban			Rural		
	Both Sexes	Male	Female	Both Sexes	Male	Female	Both Sexes	Male	Female

75+	2.0	1.6	2.4	1.8	1.4	2.1	2.2	1.7	2.6

When compared with the age distribution in 2008, it is clear that Cambodia's population is slowly ageing. In 2019, 29.4 percent of Cambodia's population was aged 15 years or younger; and 8.9 percent was aged 60 years and over. The corresponding percentages in 2008 were 33.7 percent and 6.3 percent respectively. As a consequence of these changes, the median age has increased from 22 years in 2008 to 27 years in 2019 (table 3.3.2).

When broken down by urban/rural area, the working age group is larger in urban areas than in rural areas, whereas the percentage of children and older people is lower than in rural areas. This pattern appears to be a combination of a differential decline in fertility rates in rural and urban areas as well as rural-urban population movement.

Table 3.3.2. Distribution of population by broad age group, dependency ratio, median age and sex ratio, Cambodia, 2008-2019*

Age Structure and Sex Ratio	2008			2019		
	Total	Urban	Rural	Total	Urban	Rural
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Total	100	100	100	100	100	100
0-14	33.7	25.4	35.7	29.4	25.6	31.8
15-59	60.0	69.1	57.8	61.7	66.2	58.9
60 +	6.3	5.5	6.5	8.9	8.2	9.3

Median Age	22	24	21	27	28	26
Sex Ratio	94.7	92.4	95.3	94.9	95.3	94.6

**Note: These figures exclude migrants working abroad.*

3.3.1. Age Dependency Ratio

A common way to describe a population's age structure is by an index called the age dependency ratio. This index describes the proportion of a country's population that is presumed to be economically dependent, relative to its potentially productive component. This is conventionally expressed as the ratio of the young (0–14 years) and old (60+ years) populations relative to the population in working age groups (15–59 years).

The age-dependency ratio for Cambodia (table 3.3.2) declined in the period 2008-2019 (67 in 2008), indicating a reduction in the dependency burden. Cambodia's dependency ratio in 2019 was 62, which means that for every 100 persons in the working ages, there were 62 persons in the dependent age groups. A more favourable dependency ratio can be found in urban areas, with only 51.2 dependent persons per 100 working-age persons. The dependency ratio is generally higher in rural areas.

3.3.2. Population Pyramid

Figures 3.3.2.1, 3.3.2.2 and 3.3.2.3 depict the population pyramids for the total, urban and rural populations in 2008 and 2019. Each bar represents the percentage of males or females in five-

year age groups, starting with the youngest age group at the bottom and increasing with each five-year age group towards the top of the pyramid. The percentage of males is depicted on the left and the percentage of females is shown on the right side of the pyramid. The shaded area shows the percentage population in the 2008 Census, while the thickly outlined area shows the percentage population in the GPCC 2019.

A comparison of the age pyramids for 2008 and 2019 shows a fairly consistent pattern in the age distribution. The lower proportion of children in the age group 0-4 relative to the age group 5-9 is characteristic of age distributions in populations where health has been improving and fertility and mortality have been declining over time.

The 2019 age pyramid shows the usual pattern of gradually decreasing population percentages with increasing age. The pyramid shows a noticeable contraction in the age group 40-44 years. The conspicuous decline in the proportion of population in the age group 30-34 years in 2008 and eleven years later in the age group 40-44 years may be attributed to the combined effect of low fertility and high child mortality during the Khmer Rouge period (1975-79). The early 1970s saw escalating civil war and in the late 70s during the Khmer Rouge period, a large number of killings took place. The differences in the sex and age structure beyond age 40 between 2008 and 2019, reflect the high levels of mortality that were experienced, particularly by men, during the years of turmoil and internal strife in the country.

Figure 3.3.2.1. Population pyramid, Cambodia Total, 2008 and 2019

The urban pyramid for 2019 shows a decrease in the youth population, particularly those aged 15-29 years. One of the main reasons for this phenomenon could be the substantial movement of younger female labour from urban to rural areas, due to the closure of garment factories in the period of the last census.

Figure 3.3.2.2 Population pyramid, Cambodia-urban, 2008 and 2019

Figure 3.3.2.3. Population pyramid, Cambodia-rural, 2008 and 2019

The pyramids in figure 3.3.2.4 show that there are significant differences in the age structure between urban and rural areas. The rural areas tend to have relatively more people in the younger and older age groups. On the other hand, the urban areas have relatively more people in the economically active working-age groups between 20-39 years. This is an indication that young population leaves rural areas in search of economic opportunities in urban areas. The pyramid for the urban areas is rather bulky in the middle and has a relatively narrow apex. In contrast to this, the pyramid for the rural areas has a relatively broader base and an apex which is not as narrow as the

urban pyramid. This is a demonstration of the relatively higher proportions of both the young and old populations in the rural areas. These patterns were observed in both 2008 and 2019.

Figure 3.3.2.4. Population pyramid, urban-rural, Cambodia, 2019

3.4. Sex Composition

Sex composition is one of the most basic demographic indicators. It is important for demographic, economic and social analyses. Changes in sex composition can reflect shifts in the prevailing socio-economic and cultural conditions in a country.

The sex ratio is defined as the number of males per 100 females in a population. If the sex ratio exceeds 100, it indicates that there are more men than women. Conversely, if the sex ratio is below 100, it indicates that there are more women than men. The sex ratio is a crucial social indicator for measuring the degree of equality between males and females in a society at any given point of time. Apart from having a direct effect on marital prospects, it may also reflect the quality of life of males and females in segments of society where there is an imbalance. This indicator is used to study gender issues in Cambodia and throughout the world. It is collected in all demographic censuses and surveys and is included in many tables, maps and graphs in the present report. The 2008 and 2019 Censuses collected gender information and this variable was cross-classified with almost all other topics. This is a basic requirement in planning. It can help to address gender in formulating development activities and to respond effectively to any evidence of inequality.

In all countries there is usually a difference in the number of male and female births. Male births normally exceed the number of female births and studies have shown that the sex ratio at birth ranges from 102 to 110 in most countries (Haupt et al., 2011). The current estimated sex ratio at birth for Cambodia is 105.

According to the results of the 2019 Census, the sex ratio for all ages is 94.9 males for every 100 females. This means that the number of women is greater than the number of men. In most

countries, the sex ratio is between 95 and 105. The sex ratio in Cambodia has remained relatively stable since 2008.

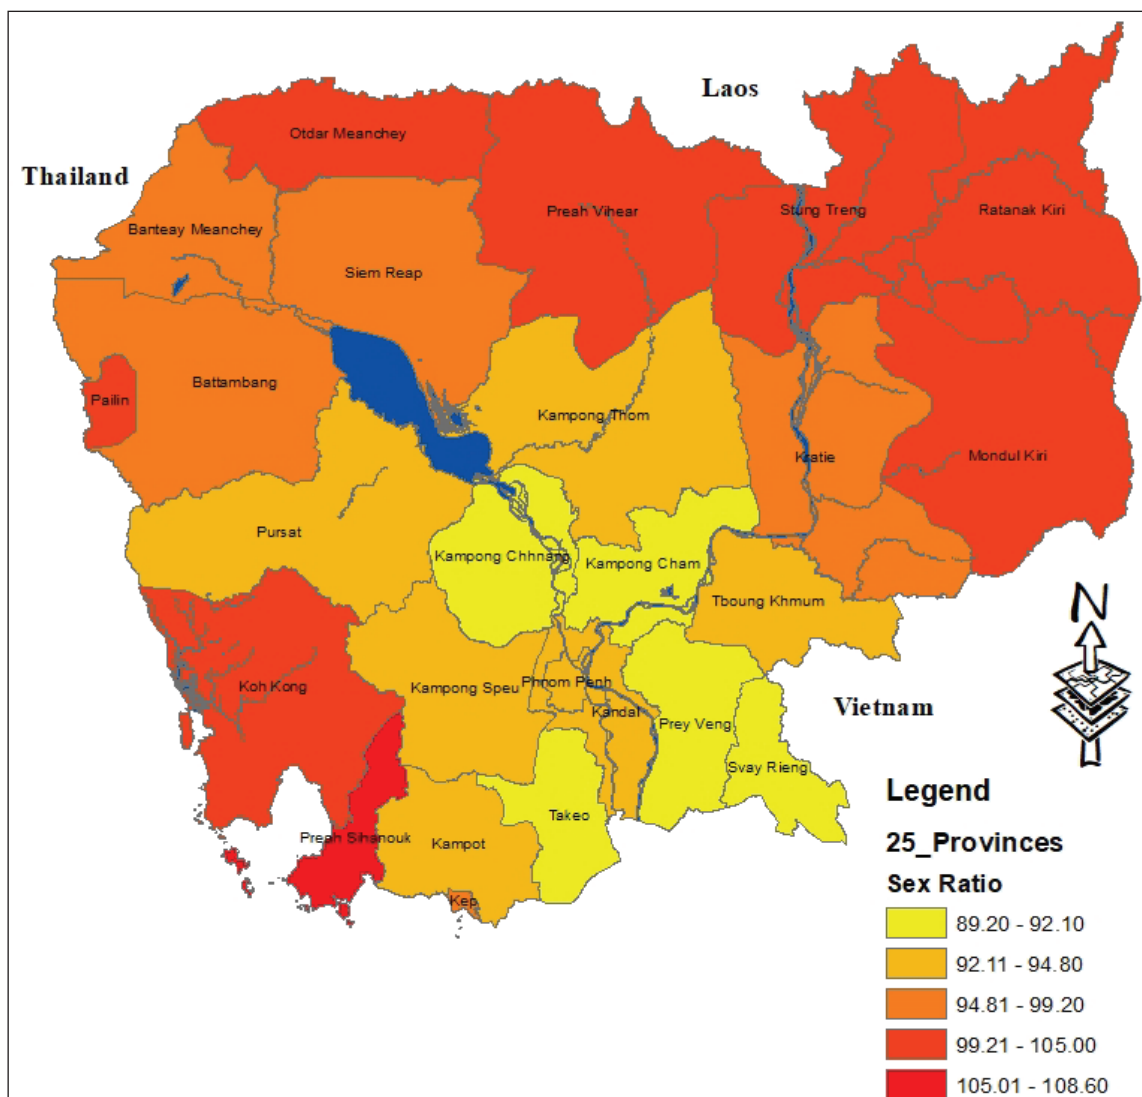

The sex ratio differs from province to province (table 3.4.1). In 2019, there were 8 provinces where the sex ratio exceeded 100. Those provinces are Preah Sihanouk (108.6), Mondul Kiri (105.0), Stung Treng (103.8), Pailin (102.9), Ratanak Kiri (102.3), Otdar Meanchey (102.0), Koh Kong and Preah Vihear (101.6). The sex ratio in Phnom Penh was only 94.0. Prey Veng had the lowest sex ratio: it is possible that this reflects male migration to work in factories or other economic sectors elsewhere in Cambodia or abroad.

Table 3.4.1. Distribution of population by sex ratio area, sex and province, Cambodia, 2008-2019*

Area/Province	2008		2019		Sex Ratio	
	Male	Female	Male	Female	2008	2019

Map 3.4.1 Distribution of population by sex ratio and province, Cambodia, 2019

Sex ratios in Cambodia vary widely by age group (table 3.4.2). In the 2008 and 2019 Censuses, there were more females from age 20-24 years onwards and there was a noticeable surplus of males in the younger age groups.

Table 3.4.2. Distribution of population by sex ratio, age group, Cambodia, 1998-2019*

Age Group	Sex Ratio		
	1998	2008	2019

3.5. Marital Status and Age at First Marriage

3.5.1. Marital Status

Marital status is a very important factor in population dynamics. It affects fertility and mortality, as well as migration (albeit to a lesser extent). Table 3.5.1 below presents the distribution of persons aged 15 years and above by marital status and sex. Responses to the question on marital status in GPCC 2019 were grouped into the following categories: never married, currently married; widowed, divorced and separated. A person is considered currently married if by law or local custom and tradition, he or she acknowledged to be married or was living with someone of the opposite sex as husband and wife. In the GPCC 2019, most of the of the population aged 15 years and above (66.2 percent) were currently married. The never married population accounted for 27.5 percent of the population. The proportion of the widowed and divorced/separated population was 6.3 percent combined. However, there were relatively more widowed and divorced/separated females than males. This is partly a result of higher male mortality. It also shows that men tend to remarry more than women in most cases. This pattern is due to many factors. For example, men often depend on women when it comes to household responsibilities and this phenomenon is common in many countries across the world.

Table 3.5.1. Distribution of population aged 15+ years by marital status, sex and area, Cambodia, 2008-2019*

Separated	0.1	0.1	0.2	0.1	0.1	0.1

*Note: These figures exclude migrants working abroad.

**Note: Percentage is calculated after excluding those for whom marital status was not reported.

Figure 3.5.1 shows that 98.2 percent of males and 91.5 percent of females aged 15-19 were never married. By the age of 30-34, the proportion of those never married was reduced to 17.9 percent of men and 12.2 percent of women. The proportion of those who were celibate was higher for females than males in the older ages. However, the proportion of single females fell more steeply around the age of 20. The proportion of single males was much higher than the corresponding proportion of single females in every age group below 30. From the age group 40-44 onwards, the proportion of single males in each age group is lower than the corresponding proportion of females in the 2008 and 2019 Censuses.

Figure 3.5.1 Percentage distribution of never married population 15+ years by sex, Cambodia 2008- 2019

Viewed over the course of a lifetime, marriage is more universal for males. Almost all males marry at least once in their life. In the age group 50-54, only one percent of males remained never married, whereas the same statistic was five percent for females. Females tend to marry earlier than males. There was a relatively higher proportion of ever married females than males up to the age group 30-34. After this age group, ever married males had a higher proportion than their female counterparts. Also, the percentage difference between males and females increased as their age increased.

Figure 3.5.2 Percentage distribution of ever married population 15+ years by sex, Cambodia, 2008-2019

The proportion of the population aged 15 years and over that was classified as widowed, divorced or living separately, was 6.3 percent. 2.9 percent of men and 9.4 percent of women were classified in this way. Among the population aged 60 years and over, the proportion in this category was more than three times higher for females than for males (32.9 percent and 9.4 percent, respectively). The reason for this differential is partly due to higher male mortality, particularly as a result of what happened during the Khmer Rouge period, as well as the fact that widowers are more likely to remarry than widows.

Figure 3.5.3. Percentage distribution of widowed, divorced and separated population aged 15+ years by sex, Cambodia, 2008- 2019

3.5.2. Age at First Marriage

Direct questions about age of first marriage were collected from GPCC 2019 but the marriage recall questions provided significantly different results when compared with indirect calculations. As a consequence, the average marriage age was estimated using an indirect method using marital status data based on age. The singulate mean age at marriage (SMAM) (Hajnal, 1953) is an estimate of the average age of women or men before first marriage.

Based on the calculated SMAM, women marry at younger ages than men. The average age at marriage was 27.0 and 24.0 years for males and females, respectively (table 3.5.2). When compared to 2008, the average age at marriage in 2019 had increased by 1.4 years and 0.7 years for males and females, respectively.

An urban-rural difference was observed with regard to the SMAM values. For both men and women, the SMAM was higher in urban areas than it was in rural areas. In 2019, urban men seemed to have a tendency to marry later than rural men, with a male SMAM 2.1 years higher in urban areas than in rural areas. For women this urban-rural difference was 2.3 years.

Table 3.5.2. Singulate mean age at marriage by sex and area, Cambodia, 2008-2019

Area	2008			2019		
	Male	Female	SMAM Gap	Male	Female	SMAM Gap
(1)	(2)	(3)	(4)	(5)	(6)	(7)

Urban	28.0	25.5	2.5	28.1	25.0	3.1
Rural	24.8	22.5	2.3	26.0	22.7	3.3

3.6. Adolescent Marriage

At the national level, the proportion of married teens did not change much between 2008 and 2019. The proportion married among adolescents aged 15-19 in rural areas was higher than that in urban areas (table 3.6.1). Among women aged 20-24, the proportion of ever married in rural areas was almost double than that in urban areas.

Table 3.6.1. Singulate mean age at marriage and proportion ever married by sex, age group and area, Cambodia, 2008-2019

CHAPTER 4

Literacy and Education

4.1. Conceptual Background

Education is important for personal and national development. It is the right of every individual and is a key prerequisite for the development of human capacities. A good education reduces inequality in economic, socio-cultural, familial, interpersonal, legal, political and psychological fields. It is also a gateway to employment and is essential for decision-making. Education affects demographic behaviour related to marriage, fertility, mortality and migration, as well as participation in the labour force. Many research studies have established a negative relationship between the educational level of women and their fertility. Female age at first marriage and infant mortality are also influenced by the level of educational attainment. In general, educational attainment is indicative of the level of literacy within the population and is very important for the implementation of the development programmes and population policies.

An educated population is integral to achieving the Cambodian Sustainable Development Goals (CSDGs). With the benefit of education, individuals are in a better position to obtain formal employment and to create work for themselves and others. Education is a central component of Cambodia's National Strategic Development Plan, 2019-2023. To determine the level of education, the General Population Census of Cambodia, 2019 (GPCC) asked questions about school attendance and the highest level of education attained. These questions were addressed to all persons aged six and older. Questions about literacy and educational attainment were an important part of the questionnaire used in both the 2008 and the 2019 Census.

In order to obtain more complete data on education, the 2019 Census asked six questions to collect information on literacy and full-time education. The questions focused on literacy in Khmer language, literacy in other languages, school attendance, current grade enrolment, highest grade completed and the main subject of study. With the exception of the questions on current grade and major subject of study, these questions were also asked in the 2008 Census. The two new questions were included to satisfy the requirements of the national educational system.

Literacy is the ability to read and write with understanding in any language. A person is defined as literate when he/she can both read and write a simple message in a language or dialect. A person who cannot read and write a simple message in any language is considered illiterate. Persons who are only capable of reading their own name or numbers are also considered illiterate, as are those who can read but not write (or vice versa). The literacy rate is one of the most general measures of educational output and is defined as the percentage of literate people in the population of a given age. In the 2008 and 2019 Censuses, all children aged six or under were treated as illiterate, even if they were already attending school or had picked up reading and writing a few odd words in a language.

4.2. Literacy Level

The results of GPCC 2019 are presented in table 4.2.1. The table shows that the proportion of literate persons in any language among the population aged seven and older increased from 78.4 percent in 2008 to 88.5 percent in 2019. In the past eleven years, the percentage of females aged

seven and over who are literate in any language has increased by 13.1 percentage points, while the corresponding proportion among males has increased by 7.1 percentage points. However, there was a big male-female gap in literacy rates (91.1 percent for males and 86.2 percent for females in 2019). This gap was relatively higher in rural areas. In general, gender inequality in basic education is a major issue in Cambodia, requiring immediate attention.

Figure 4.2.1. Literacy rate of population aged 7+ years in any language by sex, Cambodia, 2008-2019

Literacy rates in urban areas tend to be higher than in rural areas, due to disparities in the level of development between the two areas. Nevertheless, in recent years, policies on universal primary education and the elimination of illiteracy have helped to shrink the gap in literacy rates between urban and rural areas. In 2019 the gap was 7.9 percentage points (93.3 percent in urban areas and 85.4 percent in rural areas), whereas in 2008 the corresponding gap was 14.9 percentage points.

Table 4.2.1. Literacy rate of population aged 7+ years by language, sex and residence, Cambodia, 2008-2019

Residence	Population Aged 7 +	Literate Population		Literacy rate (%)*	
		Any Language	Khmer Only	Any Language	Khmer Only
(1)	(2)	(3)	(4)	(5)	(6)
2008

2019					
Total	13,487,591	11,940,831	10,849,999	88.5	80.4
Male	6,510,705	5,928,762	5,350,494	91.1	82.2
Female	6,976,886	6,012,069	5,499,505	86.2	78.8
Urban	5,406,567	5,043,456	4,322,931	93.3	80.0
Male	2,618,772	2,485,906	2,097,551	94.9	80.1
Female	2,787,795	2,557,550	2,225,380	91.7	79.8
Rural	8,081,024	6,897,375	6,527,068	85.4	80.8
Male	3,891,933	3,442,856	3,252,943	88.5	83.6
Female	4,189,091	3,454,519	3,274,125	82.5	78.2

*Note: Percentage of literate persons is calculated after excluding individuals for whom literacy was not reported.

Table 4.2.1 shows that the proportion of persons literate in any language among the population aged seven and above accounted for 11,940,831 (88.5 percent) in 2019 and 8,959,383 (78.4 percent) in 2008. Table 4.2.2 gives the percentage distribution of literate persons by language of literacy, sex and residence for Cambodia in the period 2008-2019. Asides from the 1.5 percent of the population that was literate in a language other than Khmer in 2019, 90.9 percent of the population was literate only in Khmer, 5.1 percent was literate in Khmer and English and 2.5 percent was literate in Khmer and other languages asides from English (table 4.2.2). In 2008, only 4.9 percent of the population was literate in Khmer and English and about 2.2 percent was literate in Khmer and other languages asides from English. This shows that during the eleven years between 2008-2019, a small but increasing proportion of the Cambodian population gained foreign language skills, particularly in English. However, a higher proportion of males than females was literate in Khmer + any other language, in both urban and rural areas. And a higher proportion of the population in urban areas (12%) was literate in Khmer + any other language than in rural areas (4.4%).

Table 4.2.2. Distribution of literate population aged 7+ years by language, sex and area, Cambodia, 2008-2019

**Note: Percentage of literate persons is calculated after excluding individuals for whom literacy was not reported.*

4.3. Adult Literacy

The adult literacy rate, or the literacy rate of the population aged 15 and over, increased at the national level in the period 2008-2019 (table 4.3.1). In rural areas, the adult literacy rate increased substantially (from 74.0 percent in 2008 to 83.8 percent in 2019), with females registering a higher percentage point increase than males between 2008-2019. In urban areas, the adult literacy rate was already 90.4 percent in 2008 but rose to 93.3 percent in 2019.

The data indicate that literacy rates in Cambodia have improved substantially in the past decade. The younger the age group, the higher the literacy rate and the narrower the male-female gap. The male and female literacy rates are very close to each other for younger age groups but are wider in the age groups starting around 25 years and older. This pattern reflects the past educational disadvantage experienced by women relative to men and shows how this sex disparity has reduced in recent years.

Table 4.3.1. Adult literacy rate aged 15+ years by age group, sex and area, Cambodia, 2008-2019*

Age Group	2008			2019

60 +	50.1	75.2	32.6	71.0	83.1	63.1

**Note: Percentage of literate persons is calculated after excluding individuals for whom literacy was not reported.*

4.4. Educational Level

Educational attainment is an important indicator of population development. The 2019 Census collected data on the highest grade completed by those who ever attended a school or an educational institution, as well as the grade of those currently attending a school or educational institution. The following analysis relates to those who have reported a completed level of education. In terms of years of study, the categorization is as follows: 1= None (0 and 88), 2= Primary Not Completed: (1 to 5), 3= Primary: (6 to 8), 4= Lower Secondary: (9 to 13), 5= Secondary/ diploma [Secondary School/Baccalaureate, Technical Diploma/Pre-Secondary and

Technical Diploma/Post-Secondary] (14 to 16) and 6= Beyond Secondary [Undergraduate and Graduate/Degree Holder] (17 to 19).

Figure 4.4.1. Educational attainment of literate population aged 7+ years by educational level, Cambodia, 2008-2019

At the national level, the 2019 Census results show that 29.1 percent of those who ever attended school or educational institution had completed primary education, 21.8 percent had completed lower secondary education, 2.9 percent had received the secondary/ diploma and 2.8 percent had completed education beyond secondary level (table 4.4.1). About 42.3 percent reported not having completed primary school, while a small proportion of the literate population (1.1 percent) had become literate without any formal education. Compared to the 2008 Census, there has been an improvement in the educational attainment of the population. The proportion of the literate population that did not complete primary education decreased from 48.9 percent to 42.3 percent. And the proportion of the literate population that had completed primary school has increased marginally, by 0.9 percent. The proportion with a lower secondary education increased from 17 percent to 21.8 percent, while those with a secondary/diploma increased from 1.6 percent to 2.9 percent. Finally, the proportion that had completed beyond secondary level education increased from 1.5 percent to 2.8 percent.

**Note: Percentage is calculated after excluding those with missing data on educational level and other variables.*

In the age group 15-19, individuals have normally completed lower secondary level of education. However, the data shows that 16.7 percent reported that they had still not completed primary school. It is possible that this reflects late admission, repeating or dropping out of school. In the same 15-19 age group, 40.8 percent and 39.9 percent of persons had completed primary school and lower secondary respectively. It is also worth noting that 2.4 percent of the population in this age group reported having attained a secondary/diploma-level education.

Among the population in the 20-24 age group, 22 percent reported not having completed primary school, 31.9 percent reported having completed primary school, 33.5 percent reported lower secondary level attainment and 9.3 percent and 3.2 percent reported secondary/diploma and tertiary education (beyond secondary) respectively. Among those aged 25 years and over, the largest proportions of the literate population concerned those who had not completed primary school. When compared to 2008, the 2019 data shows some improvements in educational attainment. In particular, there was a decrease in the proportion of the population that reported not having completed primary school. And there were increases in the proportions reporting educational attainment at, or above, lower secondary/diploma level. Slightly higher proportions of males than females also reported educational attainment at the secondary and tertiary (beyond secondary) levels.

4.5. School Attendance

The question on school attendance was addressed to both literate and illiterate persons. This included children aged 6 years and under. The answer to this question was categorized as (i) “never attended” (for those who had never at any time received full-time education), (ii) “now” (for those who were still receiving full-time education at the time of the census) and (iii) “past” (for those who had received full-time education in the past). Based on the census question of whether a person was currently attending school, 90.6 percent and 91.6 percent of the 6-11 and 12-14 age groups responded positively.

Figure 4.5.1. Distribution of school attendance for population aged 6+ years, Cambodia, 2019

The corresponding proportions were smaller for each age group in 2008 (table 4.5.1). In both censuses, enrolment rates decline drastically from age 15 onwards, as more and more students drop out of school. In 2019, 16.9 percent of those aged 25 years and over reported never having attended a school or any educational institution. In 2019, the enrolment rate for girls was marginally higher than the enrolment rate for boys at ages 6-11 and 12-14 years. However, this advantageous enrolment rate for girls declines relative to boys with age. This may reflect traditional attitudes that discourage girls from continuing to study after a certain age. It is also clear from table 4.5.1, that more children in urban rather than rural areas were currently attending school at all ages.

Table 4.5.1. Distribution of school attendance of population aged 6+ years by sex, age and area, Cambodia, 2008-2019*

CHAPTER 5

Labour and Employment

5.1. Conceptual Background

Analysing the economic activity of the Cambodia population is key to designing good economic policies and development plans. This is mainly due to the fact that these policies and plans relate to issues such as improving manpower capacity, increasing productivity and minimizing unemployment and under-employment.

The General Population Census of Cambodia 2019 (GPCC) has collected information on the activity status of each household member through the following questions (listed in Form B): main activity, occupation (type of occupation/employment), employment status, nature of economic activities (agriculture, trade or service) and employment sector.

The main objective of the GPCC 2019 questions was to classify the population into two categories: the economically active (those who participate in the labour force) and the economically inactive (those who are outside the labour force). Further questions were asked to facilitate the disaggregation of the employed population by major industrial and occupational groups, as well as by sector and employment status.

The reference period for data collection in the GPCC 2019 was the twelve-month period preceding March 3rd 2019. A person was regarded as having worked if he/she had worked at least six months (183 days) or more during reference period. The terms "economically active population" or "labour force" refer to all individuals who are employed or unemployed.

Employed persons included: (1) persons who were in paid employment in public or private organizations; (2) persons who did some work for wages, salary, profit or for family gains in cash or kind during the reference period; (3) persons who did not do any work for pay or profit during the reference period, although they had a job to which they could return (e.g. off-season workers like farmers or fishermen), those on sick leave or on leave without pay, those who could not work due to a strike or lockout in the organization where they work; and (4) persons who were self-employed (e.g. shop owners, food/drink sellers, individuals practicing as doctors or lawyers).

Inactive persons included: (1) homemakers (i.e. referring to persons mostly engaged in household duties in his/her home during the reference period); (2) students (i.e. individuals primarily attending a school or educational institution); and (3) dependents (i.e. infants and children not attending school, permanently disabled persons who cannot do any work and persons who cannot work because of illness or old age). This category also includes individuals who cannot be categorized in any of the inactive categories and is dependent on others. However, if such a person was seeking or available for work, he/ she was categorized as unemployed and not as dependent. Category (4) included those who had retired from formal or informal employment and were mainly not doing other work (i.e. those who were mostly not in any kind of employment or engaged in some other type of work such as cultivation, business, trade etc.). This also included those living on agricultural or non-agricultural royalties, rent or dividends, who were neither employed nor unemployed; as well as any other person of independent means who did not have to

work. The final category (5) refers to those who were not economically active for most of the reference period and who did not come under any of the aforementioned categories.

5.2. Economically Active Population or Labour Force

The Labour Force Participation Rate (LFPR) is defined as the number of persons in the labour force (employed and unemployed) of a given age, sex and/or place of residence; divided by the corresponding total population with the same characteristics, multiplied by 100.

The economically active population includes the part of the population working in the production of material goods and services. In other words, the economically active population represents people currently working and people who are unemployed during the reference period of census data collection. As may be seen from table 5.2.1 the overall economic activity rate at the national level increased by about 3.3 percentage points in the period 2008-2019. In the case of males, there was an increase of 5.9 percent, while the corresponding rate for females is 0.9 percent.

Figure 5.2.1. Distribution of active population aged 5+ years by sex and area, Cambodia 2008-2019

The economically inactive population includes people who are not working and not seeking work during the reference period. The proportion of the population who are not economically active is higher among females (41.0 percent) than among males (34.8 percent).

Table 5.2.1. Population aged 5+ years by usual activity status, sex and area, Cambodia, 2008-2019

*Note: Percentage of usual activity status for those aged 5+ years is calculated after excluding those for whom usual activity status was not reported.

The economic activity rate or the Labour Force Participation Rate (LFPR) for children under 15 decreased from 3.1 percent in 2008 to 2.1 percent in 2019. This may be regarded as an indicator of development in the country. The working population aged 15-59 years showed an all-round improvement in 2019, as compared to the year 2008. The GPCC 2019 found an LFPR of 79.1 percent for both sexes (84.4 percent for males and 74.3 percent for females). This is the one of the highest LFPRs in the region. For example, the LFPR of males and females are 82.3 percent and 71.6 percent, respectively in Viet Nam; and 82.5 percent and 64.7 percent, respectively in Lao PDR (ASEAN Secretariat, ASEAN stats database 2018).

60 +	60.7	72.5	52.8	48.2	62.0	38.9	67.9	78.7	60.8

Figure 5.2.1 shows that women continue to enter and exit the labour force at an earlier age than men. The male economic activity rate remains higher than females for all ages from around age twenty onwards. The economic activity rates have always been higher in the rural areas than in the urban areas for males and females. This is presumably due to higher participation in agriculture in rural areas and higher school enrolment in urban areas for both sexes. Both in the urban and rural areas of the country, the economic activity rates for males are higher than that for females, although the gap between the male-female participation rates is far less in rural areas than it is in urban areas.

Figure 5.2.2 Age-specific Labour Force Participation Rates (LFPR) by sex, Cambodia, 2008-2019

5.3. Employed and Unemployed

Employment is an important indicator for assessing socio-economic development. An analysis of the changing dynamics of employment allows us to assess the impact of socio-economic transition and to propose employment policies that are appropriate to the prevailing socio-economic conditions in the country. Cambodia's economy has undergone important changes in the past few decades. These developments, combined with recent improvements in education of the labour force, have changed the structure and distribution of employed labour.

The GPCC 2019 found that a majority of the labour force was employed and only a small share was unemployed. Therefore, an analysis of the basic characteristics of the employed labour force (e.g. age, sex, marital status, sector of employment, status in employment) can do much to characterise the general status of the labour force in the country.

The employment rate is defined as the percentage of those who are employed, relative to the total number of persons in the labour force. The employment rate was found to be 98.3 percent in the 2008 Census and 98.6 percent in the 2019 Census.

Figure 5.3.1. Employment rates for population aged 5+ years by sex and area, Cambodia, 2008-2019

The unemployment rate is the ratio of the number of unemployed persons in the labour force per 100. The unemployment rate for persons aged 15 years and over in Cambodia was 1.3 percent in 2019. Since 2008, there has been a decrease in the unemployment rate in the country for both males and females. In 2019 the unemployment rates among men and women were 1.2 percent and 1.5 percent respectively. The total number of unemployed persons in the country was 122,810 persons.

Figure 5.3.2. Age-specific unemployment rates by age group and area, Cambodia, 2019

5.4. Employment Status

Five categories of employment status were identified in the GPCC 2019: employer, paid employee, own account worker, unpaid family worker and others. In the analysis below, employment status is cross tabulated with sex, age and area.

The GPCC 2019 responses on employment status show that unpaid family workers and own account workers constituted about 67.7 percent of the employed population in Cambodia in 2019 (table 5.4.1). The corresponding proportion in 2008 was 82.6 percent. This fall in the proportion between 2008-2019 is largely due to a fall in the proportion of unpaid family workers, especially among rural women. With paid employment constituting just 31.5 percent, most of the workers in Cambodia are in the informal sector (own account workers and unpaid family workers). The proportion of females in the informal sector is higher than that of males, 50.3 percent of male employed persons are own account workers. In the case of females, most reported working as unpaid family workers (35.4 percent). The proportion of own account workers and the proportion of paid employees increased between 2008-2019. In 2019 as well as in 2008, the proportion of paid employees among males was higher than the proportion among females.

In 2019, paid employees in urban areas constituted the highest proportion of respondents (53.1 percent) followed by own account workers (33.7 percent). In the case of urban employed males, the proportion of paid employees (54.8 percent) was much higher than that of own account workers (36.5 percent). This same was true for their female counterparts (51.2 percent and 30.6 percent, respectively). In the rural areas, the proportion of own account workers among males was higher than the proportion of unpaid family workers (59.6 percent and 20.2 percent, respectively), whereas the opposite trend was noticed among females with proportionately more unpaid workers (46.2 percent) than own account workers (37.2 percent).

5.5. Employment Sectors

In this section, employment is broken down into eight distinct sectors: the civil service, state owned enterprises, private Cambodian enterprises, foreign enterprises, non-profit organisations, the household sector, embassies/international organisations and others.

Table 5.5.1 shows the distribution of employed persons by sex, sector of employment and urban/rural area. The table shows that most of the employed population aged 5 and over were employed in local private enterprises (78.7 percent), followed by foreign enterprises (12.8 percent) and the civil service (4.9 percent). This leaves only 3.6 percent employed in the other five sectors.

When disaggregated by sex, it is clear that a much higher proportion of males (6.7 percent) were employed in the civil service than females (3.0 percent). In contrast, the proportion of females working in in foreign enterprises (16.6 percent) was higher than males (9.0 percent). When compared to rural areas, urban areas reported far higher proportions working in the civil service and foreign enterprise sectors. On the other hand, foreign enterprises provided proportionately more employment to women than to men. This last pattern might reflect the growth of the garment sector, which mainly employs female workers.

Table 5.5.1 Distribution of employed persons aged 5+ years by sex, sector of employment, and area, Cambodia, 2008-2019

5.6. Employment by Industrial and Occupational Classifications

The GPCC 2019 also collected data on the occupation and industrial sector of employed and unemployed persons (employed before). These data were coded at the National Institute of Statistics using the latest International Standard Industrial Classification 4 and the International Standard Classification of Occupations 88. Tables 5.6.1 and 5.6.2 present the distribution of employed persons by occupational and industrial classifications and sex. The tables show that agriculture was the predominant occupation and industrial sector.

In 2019, the majority of employed persons in Cambodia's economy were working as agricultural, forestry and fishing workers (53.4 percent), followed by craft and related workers (16.6 percent) and services and sales workers (12.6 percent). This indicates that Cambodia's labour market is still predominantly composed of unskilled workers and suggests that vocational training and qualifications that should be prioritised in Government plans.

Among the nine major occupational groups, there were only three occupations where the percentage of females was higher than that of males ("skilled agricultural, forestry and fishing", "craft and related workers" and "services and sales workers"). However, the sex differences were quite small.

Area-wise, a high proportion of employment in urban areas was in the category "craft and related workers" (28.1 percent), followed by "services and sales workers" (22.8 percent). The group "skilled agricultural, forestry and fishing workers" accounted for only 20.8 percent. However, in rural areas 74.1 percent were engaged in agricultural occupations. Agriculture still plays a major role in the rural Cambodia and this is followed by "craft and related workers" (9.3 percent) and "services and sales workers (6.1 percent)".

When compared with the 2008 Census, the proportion of employed labour working in skilled agricultural, forestry and fishing occupations declined dramatically in the 2019 Census: from 71.3 percent in 2008 to 53.4 percent in 2019. However, there were increases in other occupational groups.

*Note: Percentages are calculated excluding armed forces and those for whom occupation was not reported.

Table 5.6.2 presents the distribution of employed persons by industrial group. The economic structure of Cambodia is shifting towards industrialization and modern industry. This is evident in the decreasing proportion of workers engaged in the agriculture, forestry and fishing sector; and the increasing proportion of workers engaged in manufacturing, wholesale and retail trade, the repair of motor vehicles and motorcycles, construction and other services. The table shows that almost three quarters of all employed labour was engaged in the “agriculture, forestry and fishing” sector in 2008. However, in 2019 this had declined substantially to 54.7 percent. Other sectors which have gained in importance, include “manufacturing” (from 6.6 percent to 13.3 percent), “wholesale and retail trade”, “the repair of motor vehicles and motorcycles” (from 7.8 percent to 10.7 percent) and “construction” (from 2.0 percent to 5.2 percent). The remaining industries accounted for only a small share of labour in Cambodia.

**Note: Percentages are calculated after excluding those for whom the industrial group was not reported.*

***Note: 0.0 does not necessarily mean 0 cases but might refer to a percentage lower than 0.1.*

Figure 5.6.1 shows the proportion of the employed population engaged in three broad industrial employment sectors: primary (agriculture), secondary (industry) and tertiary (services). The primary sector relates to industrial group “A” (see table 5.6.2), the secondary sector includes “B to F” of the industrial groups, while the tertiary sector covers the industrial groups “G to U”.

Table 5.6.3 shows the proportion of employed persons aged 5 years and over by broad industrial sector (agriculture, industry and services), sex and urban/rural area. As discussed earlier, 54.7 percent were employed in the primary industry sector (agricultural, forestry and fishery workers). This was followed by tertiary industry sector (26.5 percent) and secondary sector (18.8 percent). In 2008, the corresponding proportions were: 72.3 percent, 19.2 percent and 8.5 percent, respectively.

Figure 5.6.1 Distribution of employed population aged 5+ years by industrial sectors and sex, Cambodia, 2008-2019

Table 5.6.3. Distribution of employed population aged 5+ years by industrial sectors, sex and area, Cambodia, 2008-2019*

CHAPTER 6

Migration

6.1. Conceptual Background

Migration is defined as the act of changing residency permanently from one geographical area to another. When the movement is within the same country it is described as internal migration and when it involves a change of country it is called international migration. In combination with fertility and mortality, migration determines the size and the rate of population growth, as well as its structure. The topic is of great importance and interest to demographers, economists, sociologists, human geographers, political scientists; lawyers and policy makers; planners and public administrators.

Migration is the geographic movement of people across a specified boundary for the purpose of establishing a new permanent, or semi-permanent, residence. Along with fertility and mortality, migration is a component of population change. The terms “immigration” and “emigration” are used to refer to moves between countries (i.e. international migration). The parallel terms “in-migration” and “out-migration” are used for migration within the country. For the purpose of this analysis a migrant refers to a person who has moved to the place of enumeration from another village or country where the person’s last previous residence was located.

6.2. Migrant Population

According to the 2019 Census, almost 80 percent of the population of Cambodia had never resided in a place other than where they were enumerated at the time of the census (table 6.2.1). In urban areas this percentage was lower than in rural areas (i.e. 64.7 percent, rather than 87.6 percent). To put it another way, the percentage of migrants in Cambodia in 2019 was 21.5 percent, with 35.3 percent in urban areas and 12.4 percent in rural areas. In the two previous Cambodian censuses (1998 and 2008), the percentage of migrants in the population was lower. For three decades, the percentage of the population that has always lived in the same place has increased. This pattern holds for both urban and rural areas and is similar for both males and females.

Table 6.2.1. Population that has always lived in the place of enumeration. Cambodia, 1998, 2008, and 2019*

Area	Years	Both Sexes		Male		Female	
		Number	Percentage	Number	Percentage	Number	Percentage
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
Total	1998	7,839,882	68.5	3,721,788	67.5	5,119,908	69.5
	2008	9,843,337	73.5	4,723,429	72.5	4,118,049	74.4
	2019	12,214,542	78.5	5,819,682	76.9	6,394,860	80.1
Urban	1998	768,222	36.7	380,611	37.3	387,611	36.1
	2008	1,099,780	42.1	573,790	42.8	561,990	41.4
	2019	3,967,155	64.7	1,892,834	63.2	2,074,321	66.0
Rural	1998	7,071,660	75.7	3,341,177	74.4	3,730,483	76.9
	2008	8,743,557	81.1	4,185,639	75.6	4,557,918	82.6
	2019	8,247,387	87.6	3,926,848	85.8	4,320,539	89.3

**Note: Excluding migrants whose previous residence was not classified.*

At this stage in the data analysis, it is not possible to explain these trends. A thorough analysis, including cross tabulations with other variables, would be necessary to gain a better understanding of the situation. For the time being, it is important to state that migratory movements are declining in Cambodia.

Table 6.2.2. Percentage distribution of migrants by previous residence and sex, Cambodia 2008-2019*

Previous Residence	Both sexes		Male		Female	
	2008	2019	2008	2019	2008	2019
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Number of Migrants	3,552,173	3,318,402	1,792,519	1,742,311	1,759,654	1,576,091
Total	100	100	100	100	100	100
Within the Province of Enumeration	51.3	37.1	52.3	38.0	50.4	36.1
In Another Province	46.0	58.8	45.0	57.6	47.0	60.2
Outside Cambodia	2.7	4.1	2.7	4.4	2.6	3.7

**Note: Excluding migrants whose previous residence was not classified.*

According to the 2019 Census, most migrants of both sexes have previously resided in another province (58.8 percent). In other words, current migration movements are predominantly inter-provincial. However, the 2008 Census found that migration movement was predominantly within the province of enumeration (intra-provincial). This trend was true for both males and females.

As in the previous case, an explanation of this trend requires more analyses involving additional variables. However, it is possible to hypothesize that this pattern is related to urban growth. The migration component of urbanization is usually associated with movements that involve longer distances. This might explain the pattern of increased inter-provincial migration, as rural individuals increasingly travel long distances to urban centres instead of engaging in earlier patterns of rural-to-rural intra-provincial movement.

6.3. Reasons for Migration

The Cambodian censuses have traditionally also included a question on the reason for migration. Table 6.3.1 shows the responses for the 2008 and 2019 Censuses. The main reason for migration given by the respondents was *to move with their families*. This reason for migration applies to members of a family who had to move to the place of enumeration from the previous residence because the entire family had moved. For example, if one of the members of the family (especially the head of the household) migrated to another place because a change in his/her place of work, the reason for his migration was then *transfer of workplace*. For the other members of this family who also moved with him the reason for migration was then *family moved*. Marriage is a similar case. The proportion of female migrants is higher for this reason. The percentage of migrants who have moved for the following reasons was higher among males: *transfer to workplace, in search of employment and marriage*.

Table 6.3.1. Reasons for migration by sex, Cambodia, 2008- 2019

Reasons for Migration*	Both sexes		Male		Female	
	2008	2019	2008	2019	2008	2019

Not stated	-	0.2	-	0.2	-	0.2

*Note: In 2019, the "Dislocations..." categories were added.

6.4. Urban-Rural Migration Streams

Table 6.4.1 shows the total internal migrants classified according to migration stream. According to the 2008 Census, the predominant movement was rural to rural, with rural to urban movement taking second place. The 2019 Census revealed a substantive change: rural to urban became the dominant stream, as well as urban to urban movements. This change suggests a rapid and substantial process of urbanization.

Table 6.4.1. Percentage of internal migrants in the urban-rural migration stream, by sex, Cambodia 2008 and 2019*

Migration Streams	Both Sexes		Male		Female	
	2008	2019	2008	2019	2008	2019
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Number of Internal Migrants	3,457,228	3,182,615	1,744,044	1,665,175	1,713,184	1,517,440
Total	100	100	100	100	100	100
Rural to Rural	50.9	29.0	53.3	30.7	48.5	27.1
Rural to Urban	27.5	34.0	25.6	32.4	29.5	35.7
Urban to Rural	6.5	7.0	6.8	7.6	6.2	6.3
Urban to Urban	15.1	30.0	14.4	29.3	15.9	30.8

*Note: Excluding migrants from outside Cambodia.

6.5. Duration of Residence

According to the 2019 Census, most migrants had stayed in their current place of residence at least for 10 years prior to the Census (45.3 percent, see table 6.5.1). The proportion who had stayed in their current place of residence for 1-4 years was 28.1 percent. In urban areas, the percentage distribution was similar. However, in rural areas the proportion of recent movers was much lower than in the urban areas (20.5 percent).

Table 6.5.1. Distribution of internal migrants by number of years stayed in current residence and area, Cambodia, 2008 and 2019*

Area	Year	Number of Internal Migrants	No. of Years in Current Residence					
			Total	< 1 Year	1-4 Years	5-9 Years	10-19 Years	20 + Years
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
Total	2019	3,331,120	100	9.8	28.1	16.9	22.3	23.0
	2008	3,443,581	100	8.8	26.8	18.3	21.5	24.5
	1998	3,281,414	100	10.7	24.0	15.8	42.2	7.3
Urban	2019	2,164,700	100	12.0	32.2	16.1	19.5	20.4
	2008	1,467,981	100	10.6	31.8	17.0	21.6	19.0
	1998	1,217,073	100	12.9	28.0	20.2	37.4	1.6
Rural	2019	1,166,420	100	5.7	20.5	18.3	27.5	27.9
	2008	1,975,870	100	7.6	23.1	19.3	21.4	28.6
	1998	2,064,341	100	9.4	21.6	13.3	45.1	10.7

**Note: Excluding migrants from outside Cambodia and persons whose duration of residence in place of enumeration was not reported.*

In all three censuses, a large proportion of internal migrants reported living in their current residence for ten or more years. However, these individuals are primarily concentrated in the 10-19 years category in the 1998 Census and not the 20+ category.

This likely reflects the massive population movements that took place after the end of the Khmer Rouge regime in 1979.

6.6. Migration by Age Group

As expected, most people migrated during their prime working ages, i.e. between 20 and 39 years of age. According to the 2019 Census, almost half of the migrants were within this age group, both among males and females. Moreover, almost 90 percent of migrants were in the age group 15-64 years and this pattern holds for both males and females. It is important to note that in the entire population aged 10 years and older, 48.7% percent were in the prime working age groups. The age distribution of migrants was similar to that of the population as a whole.

Table 6.6.1. Percentage distribution of migrants aged 10+ years by age group and sex, Cambodia, 2008 and 2019*

Age Group	Total		Male		Female	
	2008	2019	2008	2019	2008	2019

75 +	1.9	2.2	1.5	1.8	2.3	2.6

**Note: Excluding migrants from outside Cambodia.*

6.7. Economic Activity of Migrants

Table 6.7.1 indicates that a high percentage of migrants were engaged in rural activities. However, the rest of the migrants reported working in mainly urban occupations. Most reported working in *wholesale and retail trade; repair of motor vehicles and motorcycles* (17.2 percent) and *manufacturing* (14.0 percent), which mainly can be found in urban areas.

Table 6.7.1. Percentage distribution of internal migrants aged 5+ years who are economically active by major industry group, sex and area of prior residence, Cambodia, 2019*

Major industry group	Total			Urban			Rural		
	Both sexes	Male	Female	Both sexes	Male	Female	Both sexes	Male	Female

U - Activities of Extraterritorial Organizations and Bodies	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0	0.0

*Note: Excluding migrants from outside Cambodia and persons whose nature of economic activity is not reported.

**Note: 0.0 does not necessarily mean 0 cases but might refer to a percentage lower than 0.1.

Migrants had approximately the same activities as the population in general (see table 5.6.2). This is a very important issue because there seem to be no special activities that attract migrants in Cambodia. Instead, it appears to be the entire economy that has labour force demands, in particular in urban areas.

6.8. Educational Characteristics of Migrants

In general, most migrants have less education than non-movers. For example, among the total population, 29.1 percent had completed primary education whereas this figure was only 27.6 percent for migrants. However, 21.8 percent of the population reported attaining a lower secondary education, while this figure was 27.5 percent among migrants (see tables 4.4.1 and 6.8.1 respectively).

However, the percentage literate among migrants and non-migrants differs: 90.1 and 88.5 percent, respectively. The reason is that illiteracy is a strong deterrent to migrate, mainly because of a lack of access to information that can facilitate successful migration, but also because the place of destination or work especially in urban areas usually requires higher qualification.

Table 6.8.1. Percentage distribution of internal migrants aged 7+ years by literacy status, educational level, sex and age group, Cambodia, 2019

Age Group	Literacy Status				Educational Level											
	Total Migrants	Total	Illiterate	Literate	Total Migrants	Total	None	Primary Not Completed	Primary Completed	Lower Secondary	Secondary School/Baccalaureate	Technical/Vocational Pre-secondary	Technical/Vocational Post-secondary	Bachelor's Degree	Master's Degree/PhD	Other

6.9. Immigrants

As indicated earlier in this section, international migrants are classified into immigrants and emigrants. The former are those who entered the country and the latter those who exited the country. In a census it is difficult to measure emigration because they were not in the country/place of enumeration during the census period. Some attempts have been carried out to estimate this population but have met with little success. Immigration is less difficult as the persons can be interviewed. In the 2019 Census, data about the respondent's previous place of residence and place of birth were collected.

Table 6.9.1 shows the distribution of economically active immigrants according to the nature of the economic activity that they were engaged in. Most immigrants were working in agriculture. However, proportionately fewer than within the entire population (38.4 percent rather than 54.7 percent). When compared with the total population, more migrants worked in wholesale and retail trade, construction and manufacturing (compare table 6.9.1 with table 5.6.2).

Table 6.9.1. Percentage distribution of immigrants aged 5+ years who are economically active, by sex and major industry group, Cambodia, 2019

Major Industry Group	Both Sexes	Male	Female
(1)	(2)	(3)	(4)
Total Immigrants	98,605	58,746	39,859

CHAPTER 7

Fertility

7.1. Conceptual Background

Fertility refers to the number of live births women have in their lifetime. It differs from fecundity, which denotes the physiological capability of women to reproduce. Fertility is directly determined by a number of demographic factors called intermediate variables (age at marriage, use of contraception, period of breastfeeding, etc.). These factors are, in turn, affected by other social, cultural, environmental, economic, and health factors.

There are two types of fertility measures, the current (period or cross-sectional) measures and cumulative (cohort) measures. Current fertility measures refer to the present fertility of the population, whereas cumulative fertility measures refer to the fertility that has taken place at an earlier point until the present.

Current fertility data is usually collected by the vital statistical system through birth registration. If the respective data is not collected or is incomplete (as in Cambodia) the census is a major source of these data. The 1998, 2008 and 2019 Cambodian Censuses, measured current fertility by gathering data on children born during the 12 months prior to the date of the census (by age of woman). From this census item it is possible to compute Age-Specific Fertility Rates (ASFR) and the Total Fertility Rate (TFR).

The ASFR is the number of births to women of a given age group divided by the number of women in that age group (multiplied by a constant, usually 1,000). It is usually presented as a set of rates for each five-year age group of women of reproductive age (see table 7.2.1). Operationally, the TFR is the sum of the ASFR multiplied by five. Conceptually, it is more complicated. The TFR is the average number of children that would be born to a woman by the time she ended childbearing, if she were to pass through all her childbearing years conforming to the age-specific fertility rates of a given year. The TFR is one of the most useful indicators of fertility because it gives the best picture of how many children women are currently having. The TFR sums up, in a single number, the fertility of all women at a given point in time. In effect, it says: this is the total number of children a woman would have if the fertility rates for a given year applied to her throughout her reproductive life. The TFR is a synthetic measure: no individual woman is likely to pass through three decades conforming to the age-specific fertility rates of any single year. In reality, age-specific rates change and fluctuate from year to year, even if only gradually.

In addition to ASFR and the TFR, there are several other fertility measures. However, these are of limited use because they are very much affected by the age composition of the population. They suffer serious distortions in their level of fertility not because of the number of births per woman, but because of the number of women in reproductive age (which is affected by the age-composition of the population).

The ASFR and the TFR are not affected by the age composition of the population but they have other problems, mainly under-enumeration. As mentioned above, most of these methods compute ASFR and TFR using the births occurring to women during the 12 months immediately preceding the census. When tabulated by five-year age groups of women, this information can

provide direct measures of ASFR and TFR. However, as suggested before, these rates usually underestimate fertility because of under-reporting problems. Using another fertility question included in the census (i.e. the number of children ever born to women) the under-estimated fertility can be adjusted.

7.2. Estimates of Fertility

Indirect methods were developed to deal with inaccurate or incomplete data. William Brass developed a method directed to reduce this limitation, and other demographers improved on this method. Eduardo Arriaga's approach (Arriaga, 1994) is used here (see table 7.2.1).

Table 7.2.1. Estimated age-specific fertility rate and total fertility rate by area, Cambodia, 2019

Age-Specific Fertility Rate	Total	Urban	Rural
(1)	(2)	(3)	(4)
15 - 19	0.03215	0.02299	0.03800
20 - 24	0.12595	0.09591	0.15108
25 - 29	0.13661	0.12315	0.15224
30 - 34	0.10811	0.10630	0.11432
35 - 39	0.06192	0.06053	0.06546
40 - 44	0.02800	0.02632	0.02963
45 - 49	0.00962	0.00859	0.01034
Total Fertility Rate	2.51	2.22	2.81
Crude birth rate	37.73	31.81	41.83
General Fertility Rate	52.15	41.74	59.32
Child Woman Ratio	341.16	287.15	379.70

According to table 7.2.1, the TFR in Cambodia was 2.5 children per woman in 2019. Considering that the date of the Census was the 3rd March 2019. The 12 months prior to the Census were 3rd March 2018 to 2nd March 2019. This corresponds to exactly 3rd August 2018.

Fertility has declined a little since 2008, when the TFR was 2.7. According to these data the population is near a stage that is called "replacement" (i.e. a fertility level in which a population exactly replaces itself from one generation to the next). One of the most common misconceptions about population growth is that a population stops growing once replacement level fertility is reached (a roughly two-child per woman average). In fact, due to population momentum, a country's population can continue growing for another 70 years once replacement level fertility has been reached. Fertility has a lot to do with the age structure of the population. The higher the percentage of young people (especially those under age 15), the more the population will continue to rise as this large cohort enters their reproductive years (i.e. ages 15-49). Once this young group moves beyond childbearing age, however, the momentum will decrease and population can begin to stabilize so that births and deaths balance out (assuming fertility rates remain at, or below, replacement levels).

Table 7.2.1 also shows the differences between urban and rural fertility. In general, fertility in Cambodia is lower in urban than in rural areas. However, the difference is very small: a TFR of

2.2 versus 2.8 children per woman. Usually, the difference is one child or more. For example, in 2008 the rural TFR in Cambodia was 2.9 children per woman and 1.9 in urban areas.

In addition to that difference, it is important to note that the TFR has increased in urban areas as compared to rural areas (from 1.9 in 2008 to 2.2 children per woman in 2019). This is not a substantial change, but it would be important to investigate this in a more in-depth study. It has probably been caused by migration.

Table 7.2.1 also shows other fertility measures. The simplest measure is the Crude Birth Rate (CBR), which is simply the number of live births per 1,000 population in a given year. As suggested before, most annual rates (such as the birth rate) relate demographic events to the population at midyear (July 1st), which is considered to be the average population at risk of the event occurring during the year. In the case of Cambodia, the CBR is 37.7 births per 1,000 population. Considering that the date of the Census is 3rd March 2019, and the period considered for the births is 12 months prior to the Census, this value corresponds to 3 August 2018.

The second measure is the General Fertility Rate (GFR), which is the number of live births per 1,000 women ages 15 to 49 in a given year. In Cambodia there were 52 births per 1,000 women in reproductive age groups. The GFR is a somewhat more refined measure than the CBR because it relates births to the age-sex group at risk of giving birth (ages 15 to 49). This fact helps eradicate distortions that might arise because of different age and sex distributions among populations. Thus, the GFR provides a better basis to compare fertility levels among populations than the CBR. Nevertheless, it is still affected by the age-sex composition of the population.

Finally, the Child-Woman Ratio (CWR) is the number of children under age 5, per 1,000 women of childbearing age in a given year. This measure is preferred when data for the TFR are not available. However, it is also affected by the age distribution of the population and under-enumeration. In the case of Cambodia, there were 341 children per 1,000 women.

These measures are consistent with the ASFR and TFR in terms of the level of fertility that they indicate: low fertility with little difference between urban and rural areas. It is important to remember that all these measures correspond to the period 3rd March 2019 to 2 March 2018 or, exactly to 3 August 2018.

Table 7.2.2 shows the TFR according to other indirect methods and direct calculation. There are differences among the methods, but they are small. It was decided to use Brass-Arriaga because it is considered to be the most suitable approach for Cambodia and, therefore, the most utilized method in this analysis. The Gompertz method is also considered trustworthy in terms of providing a suitable TFR; however, the adjustment of the ASFR has some complications.

Table 7.2.2. Estimates of fertility using different indirect methods, Cambodia, 2019

Method	Total Fertility Rate (TFR)
(1)	(2)
Brass-Arriaga	2.51
Mortara	2.95
Rele	2.35
Gompertz	2.74
Unadjusted	1.67

It is interesting to observe that the unadjusted TFR is much lower than the adjusted approaches (1.7 children per woman). This indicates a serious under-reporting of children born in the 12 months prior to the Census. This problem is common in many countries. It is related to the non-declaration of children born during the year before the census but who died, as well as errors in the temporal location of the birth, superstitions, and memory lapses if the person who is answering the questionnaire is not the mother. In Cambodia, under-enumeration is significant but not large enough to prevent a reliable adjustment.

Figure 7.2.1 shows the ASFRs (adjusted) corresponding to the 2008 and 2019 Censuses. The shape of the curves indicates that fertility increases with age, reaching its peak in age group 25-29 and then experiencing a decline. This shape indicates that a moderate proportion of women have children too young or too old. For example, teenage fertility is 32 births per 1,000 women. Although it is a low rate, efforts should be made to reduce it even more, considering the negative individual and social consequences of teenage pregnancy. At the other extreme, 1,000 women who are finishing their reproductive life (45-49) had 10 children on average.

Figure 7.2.1. Age-specific fertility rate, Cambodia, 2008 and 2019

Between 2008 and 2019 the pattern of ASFR did not change, although it is clear in the figure 7. 2.1 that fertility is declining evenly across the different ages. This fact deserves further research because this is not always the case in rapidly declining population.

7.3. Women by Parity and Children Ever Born (CEB)

Table 7.3.1 shows the main measure of cumulative fertility: the percentage of women according to the number of children ever born (or parity). For example, 13.3 percent of tall women older than 15 years have had 2.1 children up to the census date and 31.6 percent of women have had no children. Table 7.3.1 also shows this information by age group. For example, 25.9 percent of women aged 35-39 years had 3 children.

The last column in table 7.3.1 shows the mean number of CEB by age of women. For example, women 20-24 had an average of 0.5 children by the time of the Census, whereas women 50-54 had 3.4 children. The number of CEB corresponding to women at the end of their reproductive life (45-49 years) is called “completed fertility”, and according to table 7.3.1 this was 3.1 children.

As the age of women increases, the number of children also increases. The exception are the older age groups. This apparent fertility decline appears to be caused by the “memory effect”, i.e. women forget to declare some children, mainly if they have died.

This information suggests that fertility has never been very high in Cambodia. For example, the largest mean number of children is 4.0 which corresponds to women aged 70-74 by the time of the Census.

Table 7.3.1. Women by parity and children ever born, Cambodia, 2019

Age Group	Parity								Children Ever Born	
	Women	0	1	2	3	4	5+	Total	Number	Mean

85 +	42423	20.3	9.3	10.7	9.9	12.4	37.4	100	156368	3.69

The information is also presented by urban and rural areas (tables 7.3.2 and 7.3.3). As expected, fertility in rural areas is higher than in urban areas. For example, the mean number of CEB in urban areas is 1.7 children per woman, whereas it is 2.3 in rural areas. Also, completed fertility is 2.7 in urban areas and 3.3 in rural areas. In the rural areas, among those in the older age groups, 45 percent of women have had 5 children or more while in the urban areas this percentage is only a little over 30 percent.

45 - 49	147.149	11.5	10.7	24.0	24.6	15.7	13.5	100	402,253	2.73
50 - 54	133.905	11.3	10.4	20.5	21.2	16.7	19.9	100	401,840	3.00
55 - 59	121.252	10.9	10.1	17.1	17.8	16.3	27.8	100	406,013	3.35
60 - 64	102.367	11.5	10.7	14.9	15.0	15.2	32.9	100	362,969	3.55
65 - 69	78.168	12.9	11.9	14.6	13.6	13.8	33.3	100	276,698	3.54
70 - 74	52.744	14.6	12.4	13.8	12.3	13.1	33.8	100	186,531	3.54
75 - 79	32.347	17.0	11.7	12.9	12.0	13.4	32.9	100	112,316	3.47
80 - 84	19.398	19.8	10.7	11.7	10.9	12.6	34.3	100	67,489	3.48
85 +	14.758	22.7	11.6	11.2	10.1	12.5	32.0	100	48,728	3.30

Cumulative fertility in rural areas is certainly higher than in urban areas, as it is the case in most countries. More research is needed to fully understand the particular case of Cambodia.

In this final paragraph it is important to discuss briefly some consequences of fertility decline that Cambodia might be facing in the future. Most demographers and economists have considered high fertility as negative for socio-economic development. This is because resources that

otherwise could be used for investment in economic growth and social progress have to be expended on the large infant and child population, which is considered unproductive. A high fertility rate was considered an important limitation to economic and social growth. Now that fertility has declined substantially in many developing countries, these countries are experiencing the opposite situation: population ageing. An elderly population is also unproductive and can become a burden on the society and a barrier to development.

However, between the two extremes (a young and an old population) there is an intermediate situation that may be highly favorable to development. This is frequently called the “demographic window of opportunity” or the “demographic dividend”. This window arises from the fact that just after fertility has declined substantially, the population of working age, (as a fraction of the total population) is unusually high. Because fertility rates have recently fallen, there are not yet as many older people. The process of economic and social growth can be associated with rapid economic growth, particularly if associated with investments in health and education. As the older population increases, the window of opportunity will also gradually close. It is important to point out that the positive results of the demographic dividend are not automatic. The government and the society in general have to take advantage of this favorable age composition of the population. The demographic dividend should receive plenty of attention among planners, administrators and politicians in the coming years.

CHAPTER 8

Mortality

8.1. Conceptual Background

Mortality refers to deaths that occur within a population. The probability of dying during a given time period is linked to many factors, such as age, sex, education, occupation, and economic status. The incidence of death can reveal much about a population's standard of living and health care.

Actually, the most important determinant of mortality is age. Particularly important is mortality under 5 years of age. This has three indicators: the infant mortality rate (IMR), which is the number of deaths of infants under age 1 per 1,000 live births in a given year; child mortality rate (CMR), which is the number of deaths of children between 1 and 4 years of age per 1,000 children of those ages; and the under-five mortality rate (UMR), which is the probability of death from birth to age 5.

As mentioned above, the level of mortality is an indicator of the standard of living of a population. Under-five mortality and especially infant mortality are even more suitable and valid indicators.

In 2015, the world began working toward a new global development agenda under the auspices of the United Nations. The Sustainable Development Goals (SDGs) establishes new targets for development that are to be achieved by 2030. Many of these goals are related to substantial improvements in under-five mortality. In particular, SDG Goal 3 (target 2) deals directly with this issue. The proposed SDG target for child mortality aims to end, by 2030, preventable deaths of newborns and children under 5 years of age. To do so, all countries aim to reduce neonatal mortality to at least as low as 12 deaths per 1,000 live births and under-five mortality to at least as low as 25 deaths per 1,000 live births.

Many countries, including Cambodia, lack complete or reliable vital statistics systems. As a consequence, mortality measures are obtained from data that are collected from censuses and surveys. However, these data do not provide conventional mortality measures. In order to obtain standard indicators, so-called "indirect methods" are used. These methods were first developed by William Brass during the 1970s, as part of his research on the demography of Sub-Saharan Africa. Based on his work, other demographers improved or developed new methods, which allow us to measure adult mortality and develop life tables.

The purpose of this chapter is to measure infant, child and under-five mortality, as well as adult mortality (through a life table) and maternal mortality. Diverse indirect methods were used for these estimates.

8.2. Estimates of Infant, Child and Under-Five Mortality

Early-age mortality was measured by two questions in the General Population Census of Cambodia 2019 (GPCC): the number of children ever born by age of women and the number of

children surviving by age of women. Using sophisticated demographic techniques (indirect methods) it is possible to transform these data into reliable infant and child mortality rates (or probabilities of dying). The main method of indirect estimation was developed by the British demographer William Brass. Several variants have been proposed (Moultrie et al., 2013). Here, the original Brass method (improved) was used. Most indirect mortality methods utilized model life tables. There are two sets: the Coale-Demeny Regional Model Life Tables (West, North, East, and South), and the United Nations Model Life Tables for Developing Countries (Latin American, Chilean, South Asian, Far East and General)¹. In the case of Cambodia, the most suitable life table model is the North Model. This was determined using a model presented in the textbook cited in footnote 3.

Table 8.2.1 presents infant, child and under-five mortality rates estimated from the GPCC 2019 data. Compared to other developing countries in the region, estimated infant mortality is not very high, although there is clear room for improvement. For example, in Indonesia, Lao and Malaysia, the IMR is 16, 33, and 5 (both sexes), respectively. In Myanmar, Thailand and Viet Nam the IMR rates are 33, 7 and 18, respectively (United Nations, 2019).

Table 8.2.1. Estimates of early-age mortality and life expectancy by sex and area, Cambodia, 2019

Sex and Area	Infant Mortality Rate	Under-Five Mortality Rate	Life Expectancy at Birth	Reference Data
(1)	(2)	(4)	(5)	(6)
Total				
Both Sexes	17.6	28.1	75.5	2016.8
Male	20.6	31.7	74.3	2016.8
Female	14.6	24.3	76.8	2016.8
Urban				
Both Sexes	15.9	25.5	75.6	2016.6
Male	19.4	29.8	73.5	2016.5
Female	12.6	21.0	77.7	2016.6
Rural				
Both Sexes	18.5	29.5	74.5	2016.8
Male	21.3	32.8	72.8	2016.8
Female	15.7	26.1	76.4	2016.8

In general, the IMR is higher in males than in females. This pattern is considered to have biological determinants. In contrast to this, child mortality rates for females are usually higher than males, especially in countries where there are sex preferences (e.g. son preferences). In the case of Cambodia, both rates are quite similar. This suggests that even if sex preferences they exist, they do not affect child survival.

As is common in many countries, the mortality rates estimated for rural areas in Cambodia are higher than those for urban areas (see table 8.2.1). There are multiple factors to explain these differences, such as the level of parental education, access to health facilities, and hygienic

¹ Model life tables are sets of life tables based on the generalization of empirical relationships derived from a group of observed life tables. The Coale-Demeny Regional Model Life Tables and the United Nations Life Tables for Developing Countries are the two main systems of model life tables. These systems are based on empirical life tables that have been developed on the principle of narrowing the selection of a life table to those considered realistic on the basis of examination of mortality levels and patterns calculated for actual populations. These systems cover a wide variety of mortality experiences, so that one may be more appropriate than other for a particular country. Each system has *families* of life tables. The families in the Coale-Demeny system are: East, West, North and South and the families in the United Nations system are: Latin American, Chilean, South Asian, Far East and General (United Nations, 1983).

practices. Although an urban-rural difference is present in the estimates from the GPCC 2019, it is small (see table 8.2.1). It is possible that this reflects extensive and adequate health policies. However, it would be necessary to study this matter in more detail before drawing firm conclusions.

Table 8.2.1 also includes life expectancy at birth. This is a very important indicator of overall mortality, although it is strongly influenced by infant mortality. It is discussed in the next section.

Figure 8.2.1 shows the early-age mortality indicators derived from the 2008 and 2019 Census. A substantial decline can be observed between 2008 and 2019. Note that the under-five mortality rate has declined by almost half. It is possible that this change reflects problems with the data or with different calculation methods. However, the overall difference is too big to consider that as an important component. Once again, this matter necessitates more in-depth study before drawing any firm conclusions. In particular, it would be important to analyse the role of government policies. In light of the declines rates presented here, it is possible that the SDG target for child mortality (25 deaths per 1000 live births by 2030) will be accomplished.

Figure 8.2.1. Early-Age Mortality, Cambodia, 2008 and 2019

8.3. Adult Mortality and Life Tables

The life table, one of the most powerful tools in demography, is used to simulate a population's lifetime mortality experience. It does so by taking a population's age-specific death rates and applying them to a hypothetical population of 100,000 people born at the same time. For each year in the life table, death inevitably thins the hypothetical population's ranks until, in the bottom row of statistics, even the oldest people die. Life tables are used to measure mortality and also as an analytical instrument to estimate other measures.

A life table is the most frequently used method to indirectly estimate adult mortality when vital statistics are not available. These indirect estimation methods are grouped into census survival methods, growth balance methods, the extinct generation method and estimates derived from information on the survival of parents and on the survival of the spouse. The growth balance methods are the most commonly used and consist of adjusting age-sex data on the number of deaths. These data are usually collected in censuses using a question about the number of deaths in the household during a fixed period, usually a year. The sex and age of the deceased are usually also

recorded. The GPCC 2019 included a question to collect this information. The data obtained allow demographers to compute age-specific mortality rates, which are death rates calculated for specific age groups. These rates can be easily transformed into probabilities of dying at the ages defined by age group. In particular this provides an indicator of adult mortality, which is the probability of dying between ages 15 and 60 years.

The purpose of estimating adult mortality is mainly to construct life tables. Life tables are a very useful demographic tool, not only for the study of mortality but also for diverse analytical purposes. However, before moving to the construction of life tables it is necessary to examine the problems involved in collecting mortality information from questions about deaths in the household during a fixed period. In practice, respondents frequently fail to report a death in the census because of taboos, beliefs, traditions, or emotional reasons. To refer to a recent death may be an emotionally difficult experience. Another problem is that after an adult death, a household may break up and the death goes unreported. These two problems result in the under-estimation of mortality. However, it can also happen that people confuse a death in the household with a death in the wider family and the same death is reported more than once. In this case, mortality tends to be over-estimated. Errors in the perception of the 12-month period before the census can also result in an over- or under-estimate of mortality.

Most of the methods mentioned earlier, attempt to solve these death enumeration problems. For Cambodia, the growth balance equation methods were initially used. However, the results were unsatisfactory and require a more in-depth analysis that is out-with the aims of this report.

An alternative method was used in this report. The chosen approach computes a life table using just an estimate of infant mortality, which was obtained from the indirect estimates of under-five mortality (table 8.2.1) and a model life table. Complete tables were estimated using these estimates, the MATCH program from MORTPAK (United Nations, 2013) and the North model life tables.

Table 8.3.1 shows the life tables according to the census data and the method utilized. Under the table is an explanation of the columns, or functions. The most important column relates to life expectancy and, in particular, life expectancy at birth. Life expectancy describes the mortality experience of a population if the levels and trends in the table remain constant in the future. For example, a Cambodian male under 1-year old and born in 2019 is expected to live 74.3 years or probably longer. He will only live 74.3 years if mortality conditions remain constant in the future. The life expectancies corresponding to other ages are interpreted in the same way. For example, a Cambodian woman aged 40 years old is expected to live 39.3 years if the mortality conditions prevailing in 2019 remain constant.

80	0.13500	...	45366	45366	336036	...	336036	7.41	7.41

Notes: $m(x,n)$ = Age-specific central death rate.
 $a(x,n)$ = Average person-years lived by those who die between ages x and $x+n$
 nq_x = Probability of dying between exact ages x and $x+n$ (age-specific mortality rate)
 $l(x)$ = Number of survivors at age x .
 ndx = Number of deaths occurring between ages x and $x+n$.
 nL_x = Number of person-years lived between ages x and $x+n$.
 $5S_x$ = Survival ratio for persons aged x to $x+5$ surviving 5 years to ages $x+5$ to $x+10$ = $5L_{x+5}/5L_x$
 T_x = Number of person-years lived after age x .
 $e(x)$ = Life expectancy at age x .

First entry of $S(x,n)$ is for survivorship of 5 cohorts of birth to age group 0-4 = $L(0,5) / 500000$

Second entry of $S(x,n)$ is for $S(0,5) = L(5,5) / L(0,5)$

Last entry of $S(x,n)$ is $S(75+,5) = T(80) / T(75)$

The level of mortality in a country is usually indicated by life expectancy at birth and the usual practice is to compute a separate table for males and females. In the case of Cambodia, the levels of mortality indicated by the life tables seem consistent with the under-five mortality rates and with the experiences of other developing societies.

Table 8.3.2. Life Table for Females, Cambodia, 2019

Age	m(x,n)	q(x,n)	l(x)	d(x,n)	L(x,n)	S(x,n)	T(x)	e(x)	a(x,n)

Notes: $m(x,n)$ = Age-specific central death rate.

$a(x,n)$ = Average person-years lived by those who die between ages x and $x+n$

nq_x = Probability of dying between exact ages x and $x+n$ (age-specific mortality rate)

$l(x)$ = Number of survivors at age x .

ndx = Number of deaths occurring between ages x and $x+n$.

nL_x = Number of person-years lived between ages x and $x+n$.

$5S_x$ = Survival ratio for persons aged x to $x+5$ surviving 5 years to ages $x+5$ to $x+10 = 5L_{x+5}/5L_x$

T_x = Number of person-years lived after age x .

$e(x)$ = Life expectancy at age x .

First entry of $S(x,n)$ is for survivorship of 5 cohorts of birth to age group 0-4 = $L(0,5) / 500000$

Second entry of $S(x,n)$ is for $S(0,5) = L(5,5) / L(0,5)$

Last entry of $S(x,n)$ is $S(75+,5) = T(80) / T(75)$

Figure 8.3.1 shows the age pattern of mortality according to the $l(x)$ (number of survivors at age x). After an initial decline, there is a period of stabilization and then a rapid decline. This is a typical pattern. It is important to note that during the entire period, mortality is higher among males (i.e. survival is higher for females).

Figure 8.3.1. Age Composition of Estimated Survivorship by Sex, Cambodia, 2019

8.4. Maternal Mortality

Over the past three decades, high levels of maternal mortality in developing countries have been increasingly recognized as a pressing public health issue. A striking fact was that maternal mortality ratios (defined as the number of maternal deaths during a given period per 100,000 live births in the same period) in developing countries at that time were about 100 times greater than those in the developed regions. Maternal mortality was identified as the health indicator with the greatest disparity between developed and developing countries. The death of a mother during pregnancy is an indicator of the quality of health care. Most maternal deaths can be prevented. A maternal death is one of the greatest tragedies that can occur within a family and can have wide-ranging consequences for the surviving children, spouse, other family members and the broader society.

Maternal mortality has been discussed in several conferences and is an important part of the SDGs mentioned earlier in this chapter. Six targets regarding maternal mortality are included in SDG Goal 3. In particular, there is a target to reduce the global maternal mortality ratio to less than 70 per 100,000 live births by 2030.

There are several methods to compute maternal mortality. However, the most suitable and reliable is the method based on direct questions included in the census, specifically in the section on adult mortality. For a woman aged 15-49 who died during the past 12 months, the census asks whether she died while pregnant, during delivery or within 42 days of giving birth. Some other questions are also included, such as where the death took place (hospital, health center, home) and who attended to the woman prior to her death (doctor, nurse, midwife, traditional birth attendant).

As in the case of adult mortality, it is common for the census to undercount maternal deaths. There are methods to adjust the data. However, in this case, these estimates were more difficult to obtain and less reliable.

As suggested above, the questions on maternal death are included in the census questions on deaths in the household during the past 12 months. As also discussed earlier, this information underestimates the number of deaths, including those related to maternal mortality.

According to the 2019 Census data, the directly (unadjusted) estimated maternal mortality was calculated as 140.8 deaths per 100,000 live births. This indicator is likely to underestimate maternal mortality. However, the adjustment used here involves evaluating the quality of maternal death classification, for which there is an absence of formal methods. In this case, it is generally recommended not to adjust the age distribution of deaths due to maternal causes. A consistent evaluation of maternal mortality requires operations that go beyond the scope of this initial analysis. This issue will be analyzed in-depth in the thematic papers. However, it is important to mention that the unadjusted maternal mortality ratio is lower than the ratio estimated from the 2008 Census data, which was 460.8 maternal deaths per 100,000 births.

Figure 8.4.1. Maternal Mortality Rates. Cambodia, 2008, 2014 and 2019

CHAPTER 9

Disability

9.1. Conceptual Background

The General Population Census of Cambodia 2019 (GPCC) is the first time that questions on disability have been included in a Cambodian census questionnaire. Disability is measured in the 2019 Census in terms of physical difficulties experienced in daily life for people aged 5 years and over. Three main reasons for measuring disability in a census are:

- a) To inform the design of various services. This could include developing specific programmes or policies for performing services, and also for evaluating these programmes or services. Services provided might include housing, transportation, and equipment, as well as long-term professional and educational support.
- b) To track the level of the progress in primary care provision, which is in itself an indicator of the overall social situation. Assessing the level of progress includes estimating the disability rate and analysing trends over time.
- c) To monitor inequalities experienced by disabled individuals and to evaluate the impact of laws and policies prohibiting discrimination associated with disability. Data on disability can also help to assess services and programmes, which aim to achieve equal participation in all areas of life by those who experience any difficulty in daily activities.

Data on the following six types of disabilities were collected by the GPCC 2019:

1. **Disability in seeing (eyes):** a person who has some degree of difficulty seeing once their eyesight has been corrected with glasses or who is blind or not able to see anything (even light) is considered as having no ability to see or a disability in seeing. A person who is able to see clearly with one eye or can only see straight ahead is also considered to have a disability in seeing. A person who is short or long sighted, but able to see clearly because of wearing glasses is not defined as having a disability in seeing.
2. **Disability in hearing (deaf):** a person who has some degree of hearing limitation even once their hearing has been corrected with hearing aids is considered to have no ability to hear or a disability in hearing. This includes a person who hears nothing; who hears only loud noises or sounds when he/she is in a loud environment; or who has difficulty recognising sounds from other sources. Moreover, a person who does not hear through one ear but hears normally in the other ear is also considered having a disability in hearing. A person who is able to hear using a hearing aid is not considered to have a difficulty in hearing.
3. **Disability in walking or climbing stairs:** a person who has some degree of difficulty when moving around the surrounding environment using their legs is considered to have a disability. This includes those who have some problems when walking short or long distances or going up or down stairs. It also describes those who are not able to walk any distance without a break and those who are not able to walk without using a walking aid such as a stick or crutches. Finally, individuals who cannot stand for more than a few

minutes or who need a wheelchair to move from one place to another are also considered to be disabled.

4. **Disability in memorising or concentrating:** a person who has some problems with remembering or focusing on daily activities is considered disabled in memorising or concentrating. This includes individuals who have problems navigating paths, focusing on what they are doing or remembering where they lived in recent months. It also describes a person who cannot remember anything about what someone has just said to them or who seems confused or generally afraid. This could be triggered by everyday situations including high workload, drug use or other major causes.
5. **Disability in self-care:** a person who has difficulty taking care of himself/herself independently is considered to have a disability in self-care. This includes daily tasks, such as washing, dressing or doing make-up. Washing refers to the whole self-cleansing process (normally with soap and water). Washing activities include washing and collecting essential items such as soap, clothes or water. Dressing refers to all aspects of wearing clothes. A person who cannot complete these tasks on their own is considered to have this type of disability.
6. **Disability in communication due to physical, mental and/or emotional health:** a person who has physical, mental or emotional health problems; which affect speaking, hearing or comprehension; and limit daily activities. This includes those who are prone to misunderstanding during conversations or other modes of communication. Communication refers to people exchanging information or ideas with each other. This exchange is done using voice, signs or writing information that is to be exchanged.

9.2. Level of Disability

Table 9.2.1 shows the percentage distribution of the population with differing degrees of disability by sex and urban/rural area. Responses to each of the six disability types are grouped into three categories: some disability (“some difficulty”), moderate disability (“a lot of difficulty”) and severe disability (“cannot do at all”). The proportion of the total population aged 5 years and above with any type of disability was 4.9 percent (table 9.2.1). Within the total population, the rate of moderate disability was 0.9 percent and 0.3 percent for severe disability. When disaggregated by sex, disability was found to be higher for females compared to males (5.5 percent versus 4.2 percent). This pattern is consistent with moderate disability. Area-wise, the disability rate is higher in rural areas than in urban areas (5.3 percent and 4.2 percent, respectively). This pattern is true for all levels of disability, except for severe disability where the proportions for urban and rural areas are the same. The same pattern was observed for both males and females.

Table 9.2.1. Percentage distribution of population aged 5+ years by disability status, level, sex and area, Cambodia, 2019

Residence and Sex	Population Aged 5 + Years	Total	No Disability	Some Disability	Moderate Disability	Severe Disability
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Total						
Both Sexes	14,102,052	100	95.1	3.7	0.9	0.3
Male	6,825,874	100	95.8	3.2	0.7	0.3
Female	7,276,178	100	94.5	4.2	1.0	0.3
Urban						
Both Sexes	5,622,870	100	95.7	3.2	0.7	0.3
Male	2,729,610	100	96.3	2.8	0.6	0.3
Female	2,893,260	100	95.2	3.6	0.8	0.3
Rural						
Both Sexes	8,479,182	100	94.7	4.0	1.0	0.3
Male	4,096,264	100	95.5	3.5	0.8	0.3
Female	4,382,918	100	94.0	4.6	1.1	0.3

Table 9.2.2 shows the percentage distribution of the population with disability by disability level, sex and urban/rural area. Of the 689,532 individuals with a disability, 74.3 percent had some disabilities (or mild disabilities), 19.4 percent had moderate disabilities and 6.3 percent had severe disabilities (“cannot do at all”).

Table 9.2.2. Percentage distribution of population aged 5+ years with disability by level, sex and area, Cambodia, 2019

Residence and Sex	People with Disability Aged 5 + Years	Total	Some Disability	Moderate Disability	Severe Disability
(1)	(2)	(3)	(4)	(5)	(6)
Total					
Both Sexes	689,532	100	74.3	19.4	6.3
Male	286,659	100	74.6	18.8	6.6
Female	402,873	100	74.2	19.7	6.1
Urban					
Both Sexes	239,135	100	74.3	18.4	7.4
Male	100,498	100	74.4	17.8	7.8
Female	138,637	100	74.2	18.8	7.0
Rural					
Both Sexes	450,397	100	74.3	19.9	5.8
Male	186,161	100	74.6	19.4	5.9
Female	264,236	100	74.1	20.2	5.7

The 2019 disability rate for Cambodia increases as age increases (figure 9.2.1), rising from 1.2 percent for the population aged 5-14 years to 25.6 percent for population aged 60 years and above. A slight increase in the disability rate starts in the 15-34 years age group (1.4 percent), rising to 5.2 percent for population aged 35-59 years and then as much as a fivefold increase (25.6 percent) among the population aged 60 and above.

Figure 9.2.1. Percentage distribution of population aged 5+ years with disability by age group and sex, Cambodia, 2019

The proportion of the population with a disability in seeing (3.6 percent) is the highest that is observed for the different types of disability. The other types range from 2.3 percent with a disability in self-care and communication, to 2.9 percent with a disability in hearing.

Table 9.2.3. Distribution of population aged 5+ years with a disability by type and level of disability, sex and area, Cambodia, 2019

Severe Disability	0.2	0.1	0.2

9.3. Disability and Marital Status

The majority of the population aged 15 years and over with any disability that were currently married accounted for 68.6 percent. The proportion of the disabled population who were widowed was 17.4 percent; the proportion never married was 9.8 percent; divorced, 3.9 percent; and separated, 0.2 percent. The proportion of widowed, divorced and separated among disabled females was 30.1 percent. Proportionately more disabled females were widowed, divorced and separated than males in both urban and rural areas.

Table 9.3.1. Percentage distribution of population aged 15+ years with a disability by marital status, sex and area, Cambodia, 2019*

Marital Status	Both Sexes	Male	Female
(1)	(2)	(3)	(4)
Cambodia	100	100	100
Never Married	9.8	10.6	9.3
Married	68.6	80.2	60.5
Widowed	17.4	6.6	24.9
Divorced	3.9	2.4	5.0
Separated	0.2	0.2	0.2
Urban	100	100	100
Never Married	11.6	12.8	10.8
Married	67.5	78.0	60.1
Widowed	15.9	5.8	23.0
Divorced	4.6	2.9	5.7
Separated	0.4	0.3	0.4
Rural	100	100	100
Never Married	8.8	9.3	8.5
Married	69.2	81.4	60.7
Widowed	18.2	7.0	25.9
Divorced	3.6	2.0	4.7
Separated	0.2	0.2	0.2

**Note: Excluding those for whom marital status was not reported.*

9.4. Literacy and Education

Table 9.4.1 shows the literacy rate of population aged 7 and over with a disability, disaggregated by sex and urban and rural areas. The proportion of those with a disability who can read and write the Khmer language was recorded as 70.9 percent (80.7 percent for males and 63.9 percent for females), which is lower than the 88.5 percent observed in the general population (91.1 percent for males and 86.2 percent for females). For all levels of disability, the Khmer literacy rate for males was higher than for females.

Table 9.4.1. Literacy rates of population aged 7+ years with any disability by level of disability, sex and area, Cambodia, 2019*

Area and Sex	Any Disability	Some Disability	Moderate Disability	Severe Disability
(1)	(2)	(3)	(4)	(5)
Cambodia	70.9	73.3	62.4	67.7
Urban	80.1	81.9	73.1	80.0
Rural	65.9	68.8	57.1	59.3
Male	80.7	83.0	73.9	74.7
Female	63.9	66.5	54.6	62.5

**Note: Excluding those for whom marital status was not reported.*

Table 9.4.2 shows that the rate of educational attainment in the population with any disability was low. 29.9 percent of disabled persons aged 7 and above who had ever attended a school or educational institution had completed primary education; 17.3 percent had completed lower secondary education; 1.4 percent had received the secondary/ diploma (Secondary School/Baccalaureate, Technical Diploma/Pre-Secondary and Technical Diploma/Post-Secondary), and only 1.3 percent had completed tertiary/beyond secondary education (Graduate Degree, Master's Degree and Ph.D. Degree holder). Overall, 55.7 percent of the disabled population reported that they had not completed primary school, whilst a small proportion of the disabled literate population (1.4 percent) had become literate without any formal education. Compared to the general population, there was a low rate at all levels of education for those who have successfully completed their education.

9.5. Economic Activity Rates

Table 9.5.1 shows the percentage distribution of the disabled population aged 5 and above by usual activity status, sex and urban/rural area. In the GPCC 2019, the percentage of the disabled population that were employed was 52.9 percent. A higher proportion was reported among males (62.7 percent) than females (45.9 percent). The corresponding percentage of the general population that were employed was 61.2 percent, which is higher than the rate for the population with any disability. The proportion of the population with some disability that was employed was 59.0 percent, which was higher than the proportion of those with a moderate disability (36.6 percent) and those with a severe disability (32.0 percent) who were employed. The proportion of the population with a severe disability that reported being inactive, was higher in the rural areas than in the urban areas (62.8 percent and 54.7 percent respectively).

CHAPTER 10

Housing, Household Characteristics and Amenities

10.1 Housing

The General Population Census of Cambodia of 2019 (GPCC) did not include a full-fledged housing census. However, some information on housing characteristics was collected as part of the initial house listing operation, which was undertaken three days before the main census enumeration. During the house listing operation, all buildings/structures which were either partly or wholly used for residential purposes were listed by enumerators along with the households (see annex 3). The following information on household characteristics was also collected and recorded by the enumerators: (i) whether the building was wholly or partly residential and, in the latter case, the other use that the building was given over to; and (ii) the materials used for the wall, roof and floor of the building.

Table 10.1.1 Percentage distribution of residential buildings by type. Cambodia, 1998, 2008 and 2019*

Area	Total Number of Buildings	Percentage Distribution				
		Total	Wholly Residential	Partly Residential		
				Residence and Shop	Residence and Workshop	Residence and Other Use
(1)	(2)	(3)	(4)	(5)	(6)	(7)
2019						
Total	3,181,372	100	93.2	5.0	0.8	0.2

Urban	295,148	100	92.0	6.0	1.2	0.9
Rural	1,694,680	100	97.9	1.4	0.4	0.2

**Note: 1998 and 2008 excluded "Institutional Household".*

The number of buildings used for residential purposes increased from 1998 (1,989,828) to 2008 (2,637,654) to 2019 (3,181,372) (table 10.1.1). Overall, 93.2 percent of residential buildings were used wholly for residential purposes in 2019. The corresponding proportions in urban and rural areas were 89.8 percent and 95.1 percent, respectively. The proportion of buildings that were partly residential was higher in urban areas than in rural areas.

Figure 10.1.1 Percentage of residential buildings by nature of construction, Cambodia, 2019

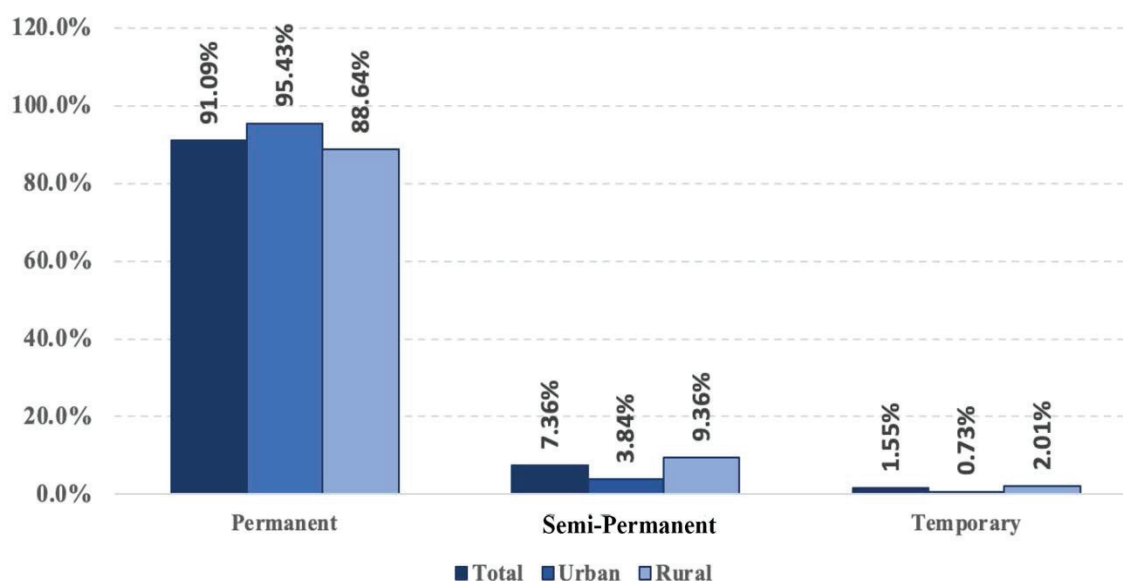

Table 10.1.2 Percentage distribution of residential buildings by nature of construction and area. Cambodia, 1998, 2008 and 2019

Urban	1,147,402	100	95.4	3.8	0.7
Rural	2,027,968	100	88.6	9.4	2.0
2008					
Total	2,637,654	100	57.0	24.6	18.5
Urban	450,345	100	86.5	9.3	4.2
Rural	2,187,309	100	51.0	27.7	21.4
1998					
Total	1,989,828	100	34.1	21.4	44.5
Urban	295,148	100	69.1	14.1	16.8
Rural	1,694,680	100	28.0	22.7	49.3

The following combination of housing materials was used to determine the quality of a building. Buildings used for residential purposes (wholly and partly) were classified as permanent, semi-permanent, or temporary on the basis of their wall and roof materials. Roofs made from bamboo, thatch, grass, plastic, or synthetic sheets were considered to be temporary. Roofs made from any of the following materials were considered to be permanent: wood, plywood, concrete, brick, stone; galvanized iron and aluminium or other metal sheets; and asbestos cement sheets and tiles. Walls made of bamboo, thatch, grass, reeds, earth and salvaged or improvised materials, were considered to be temporary. Walls made of any of the

following materials were considered to be permanent: wood, plywood, concrete, brick, stone; galvanized iron and aluminium or other metal sheets; and asbestos cement sheets.

A building or structure with a combination of permanent wall and permanent roof materials was considered to be permanent. A building with a combination of permanent wall and temporary roof materials, or temporary wall and permanent roof materials, was considered to be semi-permanent. A building with a combination of temporary wall and temporary roof material was considered to be a temporary building.

Table 10.1.2 shows that, in 2019, the materials of roofs and walls of 91.1 percent of residential buildings were permanent. 7.4 percent of buildings were classified as semi-permanent, while 1.6 percent were considered to be temporary structures when classified on the basis of the materials used to construct the roofs and walls. In rural areas, 9.4 percent of residential buildings were classified as semi-permanent and 2.0 percent as temporary buildings.

10.2 Household Characteristics

10.2.1 Number and Size of Households

The total number of households counted in Cambodia in the 2008 and 2019 Censuses were 2,841,897 and 3,594,031, respectively. The number of normal or regular households (excluding institutional households, boat households, homeless households and the transient population) were 2,817,637 and 3,553,021, respectively (table 10.2.1). The number of normal or regular households in urban areas was 506,579 in 2008. In 2019 this figure had more than doubled (1,327,014). On the other hand, the number of households in rural areas declined from 2,311,058 in 2008 to 2,224,520 in 2019.

Table 10.2.1 Number of normal or regular households and average household size, Cambodia, 2008- 2019

Area	Number of Normal Households		Change 2008- 2019	Average Household Size		Change 2008- 2019
	2008	2019		2008	2019	
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Total	2,817,551	3,553,021	735,47	4.7	4.3	-0.4
Urban	506,579	1,328,501	821,922	4.9	4.4	-0.5
Rural	2,311,058	2,224,520	-86,538	4.6	4.2	-0.4

Table 10.2.1 indicates that the average household size declined from 4.7 persons in 2008 to 4.3 persons in 2019. The average household size in urban areas declined by 0.5 in the last decades, whereas it dropped by 0.4 in rural areas. This decrease in household size, combined with an increase in the number of households in the country, points to a shift away from joint and extended family structures towards a smaller, nuclear, family structure. Normal or regular households constituted 98.9 percent of all households (table 10.2.2); institutional households constituted 1.7 percent in urban areas compared to 0.4 percent in rural areas.

Table 10.2.2 Percentage distribution of households and population by sex, type of household and area, Cambodia, 2019

Households/ Population, Sex and Area	Number	Type of Household (Percentage)					
		Total	Regular or Normal	Institutional	Homeless*	Boat	Transient*
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
Total							
Household	3,594,031	100	98.9	0.9	0.1	0.0	0.2
Population	15,552,211	100	97.6	2.0	0.1	0.0	0.3
Male	7,571,837	100	97.0	2.6	0.1	0.0	0.4
Female	7,980,374	100	98.3	1.4	0.1	0.0	0.3
Urban							
Household	1,356,374	100	98.0	1.7	0.1	0.0	0.3
Population	6,135,194	100	95.6	3.8	0.1	0.0	0.6
Male	2,993,339	100	94.6	4.7	0.1	0.0	0.6
Female	3,141,855	100	96.5	3.0	0.1	0.0	0.5
Rural							
Household	2,237,657	100	99.4	0.4	0.1	0.0	0.1
Population	9,417,017	100	99.0	0.8	0.0	0.0	0.1
Male	4,578,498	100	98.5	1.3	0.1	0.0	0.2
Female	4,838,519	100	99.4	0.4	0.0	0.0	0.1

**Note: The homeless and transient populations have been enumerated in groups.*

Data from the three censuses has consistently found that most regular or normal households consist of four members (24.9 percent in 2019, 20.7 percent in 2008 and 17.0 percent in 1998). The increasing proportion of households with less than five household members (see table 10.2.3) also illustrates the shift towards the formation of smaller households over the past three decades. Overall, the proportion of households with less than five members accounted for 60.3 percent of all households.

Table 10.2.3 Percent distribution of households by sex of head of households and household size, Cambodia, 1998, 2008 and 2019*

Sex of Household Head and Number of Usual Members	Total

10+	3.9	2.2	1.5
Total	100	100	100

**Note: Excludes institutional and boat households, as well as the homeless and transient populations.*

10.2.2 Male and Female Head of Household

About 26 percent of households were headed by females. The majority of the female heads of household were aged between 30-59 years (table 10.2.4). This pattern has declined in each of the past three censuses (68 percent in 1998, 64 percent in 2008, and 57.7 percent in 2019). The 2019 Census found that 10.2 percent of household heads were widowed, divorced or separated; 4.3 percent were never married; and 85.5 percent were currently married.

Figure 10.2.1 Female-headed households by age. Cambodia 1998, 2008 and 2019

*Note: Excludes institutional and boat households, as well as the homeless and transient populations

Table 10.2.5, 10.2.6 and 10.2.7 present the distribution of households by size of household and number of economically active members in the households. The distribution in each case is for 1,000 households. In 2019 3.3 percent of total households, 1.8 percent of male-headed households and 7.7 percent of female-headed households had no member who was earning. Female-headed households with one or two economically active members constituted about 31.9 percent and 30.6 percent, respectively.

Table 10.2.5 Distribution of 1,000 households by size of households and number of economically active members. Cambodia, 1998, 2008 and 2019*

*Note: Excludes institutional and boat households, as well as the homeless and transient populations.

Table 10.2.8 showed that the age of about 73 percent of economically active household heads ranged from 30 to 59 years old. On the other hand, about 60 percent of economically inactive household heads were in the age group 60 years and above. In the last three censuses, the proportion of older economically inactive household heads has increased (51.0 percent in 1998, 53.5 percent in 2008, and 60.0 percent in 2019). Note that the 2019 census followed a *de facto* concept of household membership. It is possible however, that the actual household heads were not counted in their respective households as they were working away from home (and were, therefore, considered as economically active).

10.2.3 Number of Rooms Occupied

The majority of households (62.6 percent) occupied only one room. In urban areas, 54.0 percent of households occupied one room; 27.9 percent, two rooms; 9.9 percent, three rooms; and 8.2 percent, four rooms and above.

Figure 10.2.2 Percentage distribution of households by number of rooms occupied, Cambodia, 2019

10.3 Household Amenities and Facilities

10.3.1 Drinking Water

As in the 1998 and 2008 Censuses, information on household amenities was collected in the 2019 Census. As defined, clean drinking water included water that was piped into the dwelling; piped into the compound, yard or plot; and water collected from a public tap, standpipe, tube well, borehole and protected well; as well as rainwater and bottled water (some of these categories were not identified in the 1998 and 2008 Censuses). In 2019, 73.0 percent of Cambodian households had access to clean water for drinking (table 10.3.1). A higher percentage of households in the urban areas had access to clean water for drinking (84.0 percent). Moreover, 73.2 percent of households in the urban areas had clean water for drinking within their premises, whereas in rural areas, it was only 58.0 percent. According to the results from the three censuses, there was an improvement in the access to water within the premises of households in the country.

Figure 10.3.1 Percentage distribution of households by location of source of drinking water and area, Cambodia, 2019

***Note:** 1. In 2008, information on piped water was collected but was not disaggregated into "piped into compound, yard or plot" and "public tap / standpipe".
2. In 2008, information related to "protected spring" and "unprotected spring" was not collected.

3. In 2008, information was collected about bought water but was not disaggregated into "tanker-truck lake", "cart with small tank / drum" and "bottled water".

4. In 1998, information was collected only relating to dug wells and did not disaggregate into "protected" and "unprotected" dug wells

5. In 1998, "spring, river, stream, lake/pond and rain" was one category.

10.3.2. Source of Lighting

A majority of households (79.6 percent) in Cambodia had access to the electricity grid for lighting in 2019. Table 10.3.2 shows that in 2019, 84.0 percent of households in Cambodia had access to electricity from city power and generators. This reflects improvements due to the government electrification program. In 1998 and 2008, these figures were only 15.1 percent and 26.4 percent. About 97 percent of households in urban areas had access to electricity for lighting in 2019, whereas the same figure was only 76 percent in rural areas.

Figure 10.3.2. Percentage distribution of households by main source of lighting and area, Cambodia, 2019

Table 10.3.2. Percentage distribution of household by main source of lighting and area. Cambodia, 1998, 2008 and 2019*

	1998	1,797,505	100	3.6	0.8	1.1	89.3	-	3.7	1.6

*Note: In 1998 “candle” was not shown separately as a source of lighting. It was included in the “other” category.

10.3.3. Toilet Facilities

Data from the GPCC 2019 shows that the presence of toilet facilities in Cambodia has significantly improved since 1998. Table 10.3.3 shows that 82.8 percent of households had toilet facilities in 2019, compared to 33.7 percent in 2008 and 14.5 percent in 1998. Furthermore, in 2019, around nine in ten households in urban areas, and almost eight in ten in rural areas, had toilet facilities. 49.6 percent of households in urban areas had a toilet with a pour flush (or flush) connected to sewerage, whereas this was only 24.8 percent in the rural areas. About 38.4 percent of households in urban areas had a toilet with a pour flush (or flush) connected to a septic tank or pit, whereas 50.6 percent of households in rural areas had access to this type of toilet facility.

In 2019, 56.7 percent of households had an improved water source, electricity and a toilet in their household. This is a significant improvement on levels observed in previous censuses. In 2008, only 17.4 percent had access to all of these amenities and, in 1998, the same figure was just 8 percent. In 2019, 75.5 percent of urban households had all three amenities, compared to 45.4 percent of rural households (table 10.3.4).

Figure 10.3.3. Percentage distribution of households by availability of toilet facilities and area, Cambodia 2019

	1998	2,817,637	100	94.0	6.0	-	-	-	-	-	-	-	-

**Note: 1. In 2008, information on “pour flush (or flush) to elsewhere (i.e, not a septic tank or pit)” and “latrine overhanging field or water (drop in the field, pond, lake, river, sea)” was not collected.
2. In 2008, “pit latrine with slab” and “pit latrine without slab or open pit” were not disaggregated.
3. In 1998, information on the type of toilet was not collected.*

Table 10.3.4 Proportion of households having access to an improved water source, electricity and a toilet within the household. Cambodia, 1998, 2008 and 2019

Total/ Urban /Rural	Percentage of Households with Combined Amenities		
	1998	2008	2019

Urban	42.9	72.5	75.5
Rural	0.9	5.34	45.4

10.3.4 Cooking Fuel

An analysis of the three censuses shows that there has been a steady decline in the proportion of Cambodian households using firewood as a cooking fuel and an increase in the use of Liquefied Petroleum Gas (LPG). However, firewood remained the main fuel for cooking in rural areas in 2019. Table 10.3.5 shows that 60.9 percent of households in Cambodia used firewood for cooking. However, in urban areas just 31.0 percent used firewood, whereas this method accounted for 78.8 percent of households in rural areas. This is more than twice the rate in urban areas. Overall, 27.7 percent of households in Cambodia used LPG for cooking. In urban areas 56.2 percent used LPG, whereas in rural areas, the corresponding figure was just 10.7 percent.

Table 10.3.5. Percentage distribution of households by type of fuel used for cooking and area, Cambodia, 1998, 2008 and 2019

Area	Year	Number of Households	Type of Fuel							
			Total	Firewood	Charcoal	Kerosene	Liquefied Petroleum Gas (LPG)	Electricity	None	Other

Figure 10.3.5 Percentage distribution of households by type of fuel used for cooking and area, Cambodia, 2019

10.3.5 Access to the Internet

The GPCC 2019 found that there has been an improvement in household access to the internet. This is mainly due to technological developments such as smartphones, which have internet access. Figure 10.3.6 shows that in 2019, about 45.4 percent of households in Cambodia had access to the internet at home and 28.2 percent had access outside of the home (public). The

percentage of households in urban areas that had access to the internet in both places (at home or public) was higher than in rural areas.

10.3.6 Personal Assets

Information about the type and number of assets owned by households was collected in the 2008 and 2019 Censuses. This information provides some insight into the economic situation of the Cambodian population. The GPCC 2019 found that the proportion of households that owned television in Cambodia was 67.5 percent, with 77.4 percent in urban areas and 61.7 percent in rural areas (table 10.3.6). Moreover, 91.9 percent of households owned a cell phone, with 94.8 percent in urban areas and 90.2 percent in rural areas. The proportion of households that owned a motorcycle was 85.1 percent in urban areas and 77.1 percent in rural areas. Just 10.1 percent of households owned a car or van. The percentage of households that owned a bicycle was 49.2 percent in urban areas and 58.8 percent in rural areas. Overall, the motorcycle remained the most of common means of transportation for Cambodian households. This was particularly true in urban areas. Televisions were also popular in urban and rural areas. This reflects increased access to electricity in the country.

CHAPTER 11

Summary and Conclusion

11.1. Demographic Indicators

According to the final results of the General Population Census of Cambodia of 2019 (GPCC), the Cambodian population numbered 15,552,211 at midnight on March 3rd 2019. The male population accounted for 7,571,837 (48.7 percent) of the population and the female population accounted for 7,980,374 (51.3 percent). These results from the GPCC 2019 suggest that the Cambodian population is smaller than the projected population, which was estimated at around 16.2 million for the same year. This suggests that Cambodian population projections should be repeated as soon as possible using the results from the GPCC 2019.

The Cambodian population has grown by more than 2.2 million people in the eleven-year period, 2008-2019. The Census suggests that the annual growth rate was 1.4 percent, which is lower than the rate from the 2008 Census (1.5 percent). This is due to fertility decline and Cambodian emigration to other countries, particularly Thailand and the Republic of Korea. The 2019 Census found that the crude birth rate (CBR) for Cambodia was 37.7 per 1000 persons. The infant mortality rate (IMR) was 19 per 1000 live births and the maternal mortality ratio (MMR) was 141 per 100,000 live births. The MMR from the 2008 Census was 461 per 100,000 live births.

11.2. Population Distribution

In terms of Cambodian population density, there was an increase of around 12 persons per km² between 2008 and 2019 (i.e. a change from 75 to 87 persons per km², respectively). The urban populations recorded in the 1998, 2008 and 2019 Censuses are classified on the basis of the revised urban classification. Overall, Cambodian census data shows a slight proportionate increase in the urban population from 1998 (18.2 percent) to 2008 (19.5 percent). However, between 2008 and 2019 urbanisation accelerated significantly, with the proportion of urban dwellers rising from 19.5 percent to 39.5 percent.

An analysis of the percentage distribution of native speakers in the GPCC 2019 found that Khmer was the predominant mother tongue used in Cambodia. Data on native languages showed that less than one percent of the population had another native language from one of the Southeast Asian languages. The rate of speakers of a minority language was about 2.9 percent of the total population.

Buddhism is the predominant religion of Cambodia (96.9 percent). 99.4 percent of the total population reported being born in Cambodia in 2019.

11.3. Sex Ratio and Age Structure

According to the GPCC 2019, the sex ratio of the total population in Cambodia was 95.7 percent. The proportion of children (under 15 years of age) has fallen gradually, from 42.8 percent

in 1998 to 33.7 percent in 2008 and then 29.4 percent in 2019. This is due to a decline in the number of births in the last decade. The age groups 55 and over have grown proportionately larger, reflecting a pattern of steady declines in adult mortality. The median age of the Cambodian population was 27 years in 2019, which is about six years higher than the same figure for 2008 (22 years). By comparison, the median age increased by roughly four years between 1998 and 2008 (from 17 years to 22 years). The Cambodian population is shifting away from a young age structure towards a more intermediate age structure, where the population is predominantly concentrated in the prime working age groups.

The Cambodian age dependency ratio has declined steadily in the period between 1998 and 2019. The proportion of the dependent population in urban areas is 51.2 persons per 100 persons of working age (age 15-59). The dependency ratio is generally higher in rural areas.

11.4. Marital Status

Females tend to marry earlier than males. There was a relatively higher proportion of ever married females than males up to the age group 30-34. After this age group, ever married males had a higher proportion than their female counterparts. Also, the percentage difference between males and females increased as their age increased. The proportion of the population aged 15 and over that was classified as widowed, divorced or living separately, was 6.3 percent. 2.9 percent of men and 9.4 percent of women were classified in this way.

11.5. Literacy and Education

Literacy rates in Cambodia have improved substantially in the period 1998-2019. This reflects the successful implementation of educational programmes aimed at raising literacy rates within younger population age groups.

The number of literate persons aged seven years and over increased from around 5.8 million to 11.9 million in the period 1998-2019. The total literacy rate is the percentage of literate population within the total population aged 7 years and over. In Cambodia, this rate has increased steadily over time, from 62.8 percent in 1998, to 78.4 percent in 2008 and 88.5 percent in 2019. There has also been a corresponding pattern of increasing literacy in both urban and rural areas. Urban literacy has risen from 78.5 percent in 1998, to 90.2 percent in 2008 and 93.3 percent in 2019. Similarly, rural literacy has risen from 59.1 percent in 1998 to 75.3 percent in 2008, and 85.4 percent in 2019.

The proportion of literate adults aged 15 years and over increased from 77.6 percent in 2008 to 87.7 percent in 2019. For more than a decade, there has also been an increase in the adult literacy rate from 85.1 percent in 2008 to 90.9 percent in 2019 for males and from 70.9 percent to 84.8 percent for females respectively. Furthermore, this increase took place in both urban and rural areas. For both sexes, the increase in literacy was higher in urban areas than in rural areas.

From 1998 to 2019, Cambodia adult literacy increased by 34.6 percent. The educational level of the population can also be measured by looking at the highest level of education attained by those aged 25 years and over. There has been a steady increase in the proportion of individuals completing education in all categories from *primary (completed)* to *beyond secondary*. Between 2008 and 2019, there was a smaller increase in female literacy compared to males. Overall, a large

number of both males and females drop out of education as they reach the more advanced levels. However, data from 2008 and 2019 show that this pattern was more pronounced for females than males.

The results from the GPCC 2019 highlight the need for renewed efforts to improve education in Cambodia. For the past three censuses, literacy rates have been consistently lower in rural areas than in urban areas. Overall, the aforementioned patterns suggest that development plans should focus more on increasing primary school completion rates and reducing the urban-rural gap in literacy rates. Furthermore, these data suggest that renewed attention should be paid to ending or minimizing school drop-out rates. It is particularly important to increase the proportion of girls completing primary school and to enhance overall female literacy rates and levels of educational attainment.

11.6. School Attendance

The GPCC 2019 found that the enrolment rates of children in the age groups 6-11 years and 12-14 years, were 90.6 percent and 91.6 percent respectively. However, there was an increase in the rate at which students drop-out or quit school and this has led to a sharp fall in the enrolment rate of the population aged 15 years and over. Nearly a quarter of the group aged 25 years and over have never attended a school or educational institution. The enrolment rate of boys and girls aged 6-11 years was the same. However, in the 12-14 years group, the rate for boys was slightly lower than the girls. Girls' attendance rates drop as they get older. This may be due to older girls having to work to support their families.

11.7. Economically Active Population (Labour Force)

The overall percentage of the population that is economically active increased 3.3 percentage points in the period, 2008-2019 (from 58.7 percent to 62.0 percent). For males, there was an increase of 5.9 percent in the same time period (from 59.3 percent to 65.2 percent). In contrast to this, the percentage of economically active females remained fairly stable between 2008 and 2019 (58.1 percent and 59.0 percent respectively). When looking at the population aged 15 years and over, it is clear that women are more likely to enter and leave the labour force at a younger age than men. For both sexes, the economic activity rates in rural areas are higher than in urban areas. It is possible that this is due to higher levels of participation in agricultural work in rural areas, as well as higher levels of school attendance in urban areas. This phenomenon was also observed in 1998. In both urban and rural areas, male economic activity rates were higher than those of females. For those aged 15 years and over in Cambodia, 1.3 percent were recorded as unemployed in the 2019 Census. This is lower than the rate observed in 2008. The unemployment rates recorded in the GPCC 2019 were 1.2 percent for males and 1.5 percent for females respectively. As a result of the absorption of a large number of workers in the agriculture sector in rural areas, the unemployment rates in rural areas are lower than that in urban areas.

It is noted that the economic activity rate aged 15 years and over for females experienced a small drop from 76.0 percent in 2008 to 74.3 percent in 2019, whereas the opposite trend was observed for males with an increase from 80.8 percent in 2008 to 84.4 percent in 2019.

Analysing employment status revealed that unpaid family workers and the self-employed accounted for 67.7 percent of all employed individuals in Cambodia in 2019. This statistic indicates

that most of the employed persons in Cambodia were working in the informal sector. Children (i.e. those aged under 15 years) who were employed, accounted for 0.7 percent of the total employed population in 2019. This reflects a decline from 1.4 percent in 2008 and 1.5 percent in 1998. At the national level, the majority of the employed (78.7 percent) were working in local private enterprises. A higher percentage of men than women were employed in almost all areas of employment among those aged 15-59 years. However, a higher percentage of women than men were employed in urban areas, due to foreign enterprises' preference for recruiting women.

The percentage of the employed population working in the primary industrial sector (i.e. agriculture, forestry and fishing sectors) fell during the past decade (from 72.3 percent in 2008 to 54.7 percent in 2019). At the same time, the percentages working in both the secondary industrial sector i.e. the industrial sector) (from 8.5 percent in 2008 to 18.8 percent in 2019) and tertiary industrial sector (i.e. the service sector) (from 19.2 percent in 2008 to 26.5 percent in 2019) increased. This implies that the overwhelming number of workers in the agricultural sector is gradually declining, leading to a steady rise in the number of workers in other sectors. It should be noted that in 2019, the proportion of those employed in the agricultural sector was higher for females (56.5 percent) than it was for males (53.0 percent).

There are differences between urban and rural areas. In urban areas, 60.7 percent of the employed population worked in the tertiary sector or service sector in 2008. By 2019, this was 47.5 percent. In rural areas, around 84.9 percent (87.0 percent for women) of the employed population worked in the primary (or agricultural) sector in 2008. By 2019, the percentage of females working in the primary sector was 77.6 percent.

Of all employed persons, 53.4 percent worked in skilled agricultural, forestry and fishery occupations; 16.6 percent were craft and related workers; and 12.6 percent worked in services and sales. Only a small proportion of workers were employed as professionals, technicians, managers, etc. This reflects a lack of opportunities to participate in higher education and to undertake skills training. In the managerial, professional and other white-collar jobs, the proportion of women (around 7.0 percent) was lower than that of men (11.1 percent) in 2019. However, as already mentioned, the proportion of employed workers with these types of jobs was fairly low overall.

11.8. Movement and Migration

The census is the main source of information on movement and migration. Migration can be defined as the act of changing residency permanently from one geographical area to another. When the movement is within the same country it is described as internal migration and when it involves a change of country it is called international migration.

The GPCC 2019 found that the percentage of migrants in Cambodia was 21.5 percent. In urban areas this statistic was 35.3 percent and in rural areas it was 12.4 percent. According to the 2019 Census, most migrants of both sexes had previously resided in another province (58.8 percent). In other words, current migration in Cambodia is predominantly inter-provincial. In contrast to this, the predominant migration movement in the 1998 and 2008 Censuses occurred within the province of enumeration (intra-provincial).

The principal reason for migration given by the interviewees in each of the past three censuses has been *family moved*. This reason for migration applies to members of a family who had to move to the place of enumeration from a previous residence because their entire family had moved. In 2019, the percentage of migrants who moved for the following reasons were

considerably higher among males: *transfer to workplace, in search of employment and marriage*. The 2019 Census also revealed a substantive change in the main types of migration streams: rural to urban and urban to urban migration streams were the most common patterns of movement. This contrasts with the 2008 Census where the predominant stream was rural to rural, with rural to urban movement taking second place. This change suggests a rapid and substantial process of urbanization.

According to the 2019 Census, most migrants had stayed in their current place of residence at least for 10 years prior to the Census (45.3 percent). The proportion who had stayed in their current place of residence for 1-4 years was 28.1 percent.

As expected, most of the migrants were in their prime working ages, i.e. between 20 and 39 years of age. According to the 2019 Census, almost half of the migrants are within this age group (48.7 percent), both among males (49.7 percent) and females (47.8 percent). Moreover, almost 90 percent of migrants are in the age group 15-64 years (88.2 percent) and this pattern holds for both males and females.

Most of these migrants work in wholesale and retail trade; the repair of motor vehicles and motorcycles (17.2 percent); manufacturing (14.0 percent); and administrative and support service activities (4.5 percent). These are essentially urban activities.

In general, most migrants have less education than non-movers. For example, among the total population, 29.1 percent had completed primary education whereas this figure was only 27.6 percent for migrants. However, 21.8 percent of the population reported attaining a lower secondary education, while this figure was 27.5 percent among migrants.

The percentage of literates was higher among migrants than among non-migrants. Illiteracy is a strong deterrent to migrate, mainly because it limits access to information which may prevent migration.

11.9. Fertility

Fertility refers to the number of live births women have. It differs from fecundity, which denotes the physiological capability of women to reproduce. Fertility is directly determined by a number of demographic factors called intermediate variables (age at marriage, use of contraception, period of breastfeeding, etc.). These factors are, in turn, affected by many other social, cultural, environmental, economic, and health factors.

The Crude Birth Rate in Cambodia was 37.7 births per 1,000 population in 2019. The General Fertility Rate (GFR) was 52 births per 1,000 women in reproductive age groups (15 to 49 years). According to the census, the TFR in Cambodia in 2019 was 2.5 children per woman. In general, fertility is lower in urban than in rural areas. The 2019 Census found that the TFR in urban areas was 2.2 versus 2.8 in rural areas.

Currently, fertility has declined substantially in many developing countries and these countries are now near to, or experiencing, population ageing. The baby boom in the years 1980, 1990 and 2000 was a driving force behind the current workforce growth frequently called the “demographic window of opportunity” or the “demographic dividend”. This window arises from the fact that just after fertility has declined substantially, the population of working age (as a fraction of the total population) is unusually high. Because fertility rates have recently fallen, there

are not yet as many older people. Economic and social growth can be associated with rapid growth of working age population, particularly if it is associated with investments in health and education. As the older population increases, the window of opportunity will also gradually close.

In general, the government and the society in general should aim to take advantage of this favourable age composition. The demographic dividend should receive plenty of attention among planners, administrators and politicians in the coming years.

11.10. Mortality

Mortality refers to deaths that occur within a population. The probability of dying during a given time period is linked to many factors, such as age, sex, education, occupation, and economic status. The incidence of death can reveal much about a population's standard of living and health care.

Many countries, including Cambodia, lack complete or reliable vital statistics systems. As a consequence, mortality measures are obtained from data that are collected from censuses and surveys. However, these data do not provide conventional mortality measures. In order to obtain standard measures, so-called indirect methods are used. The Infant Mortality Rate (IMR) in Cambodia that was derived from the GPCC 2019 data was estimated at 17.6 per 1,000 live births. This is much lower than the 2008 IMR estimates, which was 26 per 1,000 live births. In rural areas the 2019 IMR was 18.5 per 1,000 live births, whereas in urban areas it was just 15.9 per 1,000 live births.

Note that under-five mortality rate declined by almost half between 2008 and 2019. If under-five mortality (especially infant mortality) continues declining at this rate, the SDG target for child mortality will be accomplished. According to the 2019 Census, the Maternal Mortality Ratio (MMR) in Cambodia accounted for 141 per 100,000 births. In particular, the life expectancy at birth has increased to 75.5 years for the general population (male 74.3 years and female 76.8 years). The Royal Government of Cambodia takes pride in this accomplishment.

11.11. Disability

This is the first time that questions on disability were included in a Cambodian census questionnaire. Disability was measured in the GPCC 2019 in terms of physical difficulties experienced in daily life by people aged 5 years and over (column 17 in part 2 of household information). Of the 689,532 individuals with a disability, 74.3 percent had some disabilities; 19.4 percent had moderate disabilities and 6.3 percent had severe disabilities ("cannot do at all").

The 2019 disability rate for Cambodia increased as age increased (figure 9.2.1), rising from 1.2 percent for the population aged 5-14 years to 25.6 percent for the population aged 60 years and above. A dramatic increase in the disability rate starts in the 15-34 years age group (1.4 percent), rising to 5.2 percent for the population aged 35-59 years and then increasing substantially (25.6 percent) among the population aged 60 and above.

The majority of the population aged 15 years and over with any disability were currently married. This accounted about 68.6 percent, followed by those who were widowed (17.4 percent),

divorced (3.9 percent) and separated (0.2 percent). However, there were proportionately more widowed, divorced and separated females than males in both urban and rural areas.

As in the general population, the Khmer literacy rate for disabled males was higher than disabled women. The rate of educational attainment within the disabled population was low. 55.7 percent of the disabled population reported that they had not completed primary school, whilst a small proportion of the disabled literate population (1.4 percent) had become literate without any formal education.

The percentage of the population with any disability who were employed was 52.9 percent. A higher proportion was reported among males (62.7 percent) than females (45.9 percent). The corresponding percentage of the general population who were employed was 61.2 percent which is higher than the rate for the population with any disability.

11.12 Housing and Household Characteristics

The number of buildings used for residential purposes in Cambodia increased from 1,989,828 in 1998 to 2,637,654 in 2008 and 3,181,372 in 2019. This increase was 32.6 percent during 1998-2008 and 20.6 percent during 2008-2019. In Cambodia as a whole there has been a decline in the proportion of buildings that are wholly residential. From 95.8 percent in 2008 to 93.2 percent in 2019.

When classified on the basis of the materials used to build the roof and walls, 91.1 percent of residential buildings were considered permanent; 7.4 percent were semi-permanent constructions; and 1.6 percent were temporary structures. In rural areas, 9.4 percent of structures used semi-permanent materials and 2.0 percent used temporary materials.

Normal or Regular Households

At the national level, the number of normal households increased by 26.1 percent in the period 2008-2019. In the period 1998-2008, the number of normal households declined by 30.3 percent. The average size of households declined from 5.2 in 1998 to 4.7 in 2008 and then 4.3 in 2019. In urban areas, there was a 0.5 decline in the household size during the last decade. In rural areas the decrease in household size was slightly smaller at 0.4. It is possible that this decline reflects a shift away from the traditional system of joint and extended family units towards smaller, nuclear family units.

The proportion of female-headed households has remained roughly similar since 1998, at around 26 percent. In 2019, most female heads of household were in the age group 30-59. There has been a decline in the proportion of female heads of household in these age groups since 1998 (68.0 percent in 1998, 64.0 percent in 2008 and 57.7 percent in 2019). The GPCC 2019 indicated that of all female heads of household, about 10.2 percent were widowed, divorced or separated; 4.3 percent were never married and 85.5 percent were married.

The GPCC 2019 found that there were 98.0 and 99.4 percent of normal households in urban and rural areas respectively. The majority of households lived in one-roomed dwellings accounting for 62.6 percent of households; with two-roomed dwellings accounting for 26.3 percent; three-roomed dwellings, 7.0 percent; and dwellings with four or more rooms accounting for just 4.1 percent.

Drinking Water

As in GPCC 2008, information on household amenities and facilities were also collected in 2019. 73 percent of Cambodian households had access to clean water in 2019. In 2008, this was 47.0 percent and in 1998, 21.0 percent. A larger proportion of households in urban areas had access to clean drinking water within their premises than households in rural areas (73.2 percent and 58.0 percent, respectively). Providing safe drinking water to all Cambodians (either within or very close to their premises) should be a high priority.

Source of Light

Between 1998 and 2019, there was a large increase in the proportion of the population using electricity (i.e. the electricity grid, generator and both sources together) as a light source. In 2019 this was 84.0 percent, compared to 26.4 percent in 2008 and 15.1 percent in 1998. In 2019, around 97.0 percent of households in urban areas used electricity, whereas in rural areas this was just 76.0 percent.

Toilet Facilities

About 82.8 percent of Cambodian households in 2019 had toilet facilities within their premises, whereas this was 33.7 percent in 2008 and only 14.5 percent in 1998. The percentage of households with a toilet facility in 2019 was 90.4 percent in urban areas and 78.3 percent in rural areas. About 24.8 percent of household in rural areas used a toilet facility with pour flush (or flush) connected to sewerage, and about 50.6 percent used a toilet that connected to a septic tank or pit.

Cooking Fuel

An analysis of the three censuses shows that there has been a steady decline in the proportion of Cambodian households using firewood as a cooking fuel in both urban and rural areas. However, firewood was still the main cooking fuel for people living in rural areas in 2019 (78.8 percent).

Personal Assets

Information about the type and number of assets owned by households were collected in the 2008 and 2019 Censuses. This information provides some insight into the economic situation of the Cambodian population. The GPCC 2019 found that the proportion of households that owned a television in Cambodia was 67.5 percent. Furthermore, 80.1 percent owned motorcycles and 55.2 percent owned a bicycle. The percentage of households that had access to the internet was 45.4 percent at home and 28.2 percent in public or outside the home. These increases in households' asset ownership can be seen as evidence of an increase in the living standards of the Cambodian population.

GLOSSARY

Building

Building refers generally to a single structure on the ground. Sometimes it is made up of more than one component units, which are used or likely to be used as dwellings (residences) or establishments such as shops, business houses, offices, factories, workshops, work sheds, schools, place of entertainments, place of worship, stores, etc. It is also possible that buildings, which have constituent units, may be used for a combination of purpose such as a shop-cum-residence, workshop-cum-residence, office-cum-residence, etc.

Urban

The Reclassification of Urban Areas in Cambodia 2020 was undertaken by the NIS during June-July 2020 using the final dataset from General Population Census of Cambodia 2019. The urban reclassification was a comprehensive process carried out by NIS with the guidance of experts. The study provided recommendations about the classification of urban places based on a consistent set of criteria relating to population size, population density and workers in agriculture. After careful consideration of all relevant aspects - including a field study and consultation with all agencies concerned - the study decided to apply the following criteria to every commune so as to treat it as urban:

1. Economic and Demographic Aspects

- Total population of the commune in excess of 2,000.
- Population density in excess of 200 per km²
- Percentage of employment in non-agricultural occupations in excess of 50 percent

2. Statutory Administrative Aspects

The towns identified on the basis of statutory administration or recognized by degrees and laws. The first category of urban units is known as statutory towns. These towns recognised by the relevant government by law and have local bodies like municipalities/kongs, irrespective of their demographic characteristics.

3. Field visit and consultation

After careful consideration of all aspects highlighted by the field study and consultation process, the study recommended applying these criteria to every commune so as to treat them as urban. The provincial departments of planning and senior experts from the Ministry of Land Management Urban Planning and Construction, Ministry of Interior, UNICEF, UNFPA and UNHABAT were all involved in this process.

Annual Exponential Growth Rate

$$r_{EXP} = \ln\left(\frac{X_n}{X_0}\right) / n$$

X_0 is the population at the base year

X_n is the population at year 'n'

n is the number of years between X_0 and X_n

Population Density

It has been calculated as the total population divided by the total land area of a specific area. Population density is an indicator of the concentration of the population in certain areas. It is usually defined as the number of persons per square kilometer (km²).

Myer's index

This index is a measure of heaping on individual ages or terminal digits. The tendency to record or report certain ages in lieu of others is referred to as age heaping, age preference or digit preference (0 or 5). The theoretical range of Myer's index (on a 0 to 90 scale) extends from the minimum of "0", when there is neither preference nor avoidance of any particular digit at all, to a maximum of "90" when all ages are reported in a single terminal digit.

Value of Myer's Index

- | | |
|----------------------------------|-------------|
| • Highly accurate data smaller | 10.0 |
| • Accurate data from | 10.0 - 19.9 |
| • Low quality data from | 20.0 - 39.9 |
| • Data not available higher than | 40 |

Whipple's index

The age returns were also tested for digit preference and age heaping in terminal digits. The Whipple's indices were calculated for this purpose. Whipple's index is a measure of preference for ages ending in 0 and 5. Its range is from 100, indicating no preference for 0 and 5 up to 500 indicating that only 0 and 5 were reported.

Value of Whipple's index

- | | |
|----------------------------------|-------------|
| • Highly accurate data smaller | 105 |
| • Accurate data from | 105 - 109.9 |
| • Similar data | 110 - 124.9 |
| • Low quality data from | 125- 174.9 |
| • Data not available higher than | 175 |

UN Age-Sex Accuracy Index

This index is the sum of (i) the mean deviation of the age ratio for males from 100 (ii) the mean deviation of the age ratios for females from 100 and (iii) three times the mean of the age-to-age differences in reported sex ratios. In this procedure the age ratio is defined as the ratio of the population in a given age group to one-half the sum of population in the preceding and following groups.

Age

Total years completed by a person on his/her last birthday.

Population Pyramid

Population pyramids display graphically the population by group age and sex. The horizontal bar shows the number or ratio of men and women for each age group. The sum of all age groups and genders from the population pyramid is 100%.

Median Age

Before calculating the median age, we need to divide the population into two equal size groups (50% vs. 50%), one of which is younger and other of which older than median.

$$\text{Median} = L + \frac{(N/2 - C)}{F_m} \times I$$

- N = Total of Population
- L = Lower limit Median class
- F_m = Number of Median class (frequency of median class)
- C = Consecutive frequencies of pre-median classes
- I = Interval class

Sex Ratio

Is the division of the number of men and the number of women multiplied by 100. It expresses the number of males for every 100 females.

Age Dependency Ratio

The percentage of population in the younger (0-14) and older (60+) age groups relative to the population in the age group 15-59. This ratio can also be calculated as a youth dependency ratio

(with only the young dependent population in the numerator) and an old-age dependency ratio (with only old-age dependent population in the numerator).

Singulate Mean Age at Marriage (SMAM)

The mean age at first marriage is used for people whose classification by age and marital status provides unique data on marital status. It compares the specific age ratio of those who never married to those who married and considers the average age at which the change is made. For details of the method developed by John Hajnal.

$$SMAM = \frac{d + \sum 5 S_x - 50 * S_{50}}{1 - S_{50}}$$

- d = Lowest age married = 15
- $\sum 5 S_x$ = Total proportion of population never married 5 years old
- S_{50} = Proportion of population never married age 50

Literacy

Literacy is the ability to read and write with understanding in any language. A person is defined as literate when he/she can both read and write a simple message in a language or dialect. A person who cannot read and write a simple message in any language is considered illiterate. A person is considered illiterate if they have the ability to read and write only their own name or a few numbers. It includes those who can read but can't write or can write but can't read.

A person who had learned to read and write but, at the time of the census, were unable to read and write due to a physical problem or illness, were considered literate. One example of this is an older person who can read and write but can no longer perform these activities due to poor eyesight. People with disabilities who can read and write through methods such as the Braille system, were also considered literate. By definition, all children under the age of six were considered illiterate.

General Literacy

Percentage of the literate population as a proportion of the total population (excluding children aged 0-6 years).

Adult literacy rate

The percentage of the literate population aged 15 and above within the total population aged 15 and above.

Educational level

The completed level of education has been classified as follows: 1= None: (0 and 88), 2= Primary Not Completed: (1 to 5), 3= Primary: (6 to 8), 4= Lower Secondary: (9 to 13) 5= Secondary/ diploma: [Secondary School/Baccalaureate, Technical Diploma/Pre-Secondary and Technical Diploma/Post-Secondary (14 to 16)] and 6=Beyond Secondary [Undergraduate and Graduate/Degree Holder (17 to 19)].

Economically Active Population (or Labour Force)

Persons reporting their main activity as “employed” or “unemployed” during the reference period of one year preceding the census date.

Economically Inactive Population

Population other than the economically active population in the year prior to the census.

Labor Force Participation Rate

Labour Force Participation Rate (LFPR) is defined as the number of persons in the labour force (employed and unemployed) at a given age and sex and/or place of residence, divided by the corresponding total population with the same characteristics, multiplied by 100.

Economically Active Rate of the Working Age Population

The proportion of the economically active population within the total population aged 15-59.

Economically Active Rate by Age

Percentage of the economically active population compared to the total population for each age group.

Employed

Comprises persons who were in the following categories for 6 months (183 days) or more during the one-year period prior to the census date:

(i) persons who were in paid employment (e.g. working in public or private organization etc); (ii) persons who, during the reference period, performed some work for wage, salary, profit or for family gain in cash or kind; (iii) persons who did not do any work for pay or profit during the reference period although they had a job to which they could return (e.g. off-season workers like farmers or fishermen), those on sick leave or leave without pay, those who could not work due to

strike or lockout in the organization they were working; (iv) persons who were self-employed (e.g. shop owners, food/drink sellers, individuals practicing as doctors or lawyers etc.)

Employment rate

The employment rate is the number of employed people expressed as a percentage of the labor force (economically active population).

Unemployed

Persons who were without employment, but were seeking employment or available for employment for 6 months (183 days) or more during the one-year period prior to the census.

Unemployment rate

The unemployment rate is the number of unemployed people (previously employed plus never employed), expressed as a percentage of the labour force (economically active population) .

Industrial Classifications

Industry (or branch of economic activity) refers to the activity of the establishment or enterprise in which the individual works. Industries are grouped according to following sectors:

Primary Sector: Section A (Agriculture, Forestry and Fishing) of the International Standard Industrial Classification (ISIC)

Secondary Sector: Section B (Mining and Quarrying), C (Manufacturing), D (Electricity, Gas, Steam and Air-Con Supply), E (Water supply, Sewerage, Waste Management and Remediation Activities), F (Construction) of the International Standard Industrial Classification (ISIC)

Tertiary Sector: Sector G (Wholesale and Retail Trade, Repair of Motor Vehicles and Motorcycles), H (Transportation and Storage), I (Accommodation and Food Service Activities), J (Information and Communication), K (Financial and Insurance Activities), L (Real Estate), M (Professional, Scientific and Technical Activities), N (Administrative and Support Service Activities), O (Public Administration and Defense, Social Security), P (Education), Q (Human Health and Social Work Activities), R (Art, Entertainment and Recreation), S (Other Service Activities), T (Use Activities of Household as Employers), U (Activities of Extraterritorial Organizations and Bodies) of the International Standard Industrial Classification (ISIC)

Migration

Migration is the process of changing from one geographical location to another. When a movement is within the same country, it is considered domestic (or internal) migration. Movements involving migration between countries are considered international migration.

Immigration and Emigration

The terms immigration and emigration refer to moves between countries (international migration).

The immigration rate is the number of immigrants arriving at a destination per 100 people at that destination in a given year.

The emigration rate is the number of emigrants departing an area of origin per 100 people at that destination in a given year.

The parallel terms “in-migration” and “out-migration” are used for movement within a country (internal migration).

Gender

Refers to roles, attitudes and values assigned by culture and society to women and men.

Average Household Size

This is the average number of persons in normal or regular households (i.e. excluding institutional and homeless households; households on boats, and transient populations).

Head of Household

For census purposes the head of household is a person who is recognized as such by the household members. He or she is generally the person who bears the chief responsibility for the management of the household and takes decisions on behalf of the household. The head of household need not necessarily be the oldest member. The head of household can be male or female. The name of the person who is recognized by the household as its head was recorded in the census. In the case of an absentee household head, the person who was responsible for managing the affairs of the household was regarded as the household head for the census purposes.

Household

A group of people who live together and eat from the same kitchen. This includes those who live together but have a special job that prevents them from eating with the other members.

Live Birth

This refers to the complete expulsion (delivery) or extraction from its mother of a product of conception (baby), irrespective of the duration of pregnancy. The baby after such separation breathes or shows other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached. Each product of such birth is considered as live birth.

Fertility

Fertility is defined as the childbearing performance of a woman or group of women measured in terms of the actual number of children born.

Crude Birth Rate (CBR)

Crude Birth Rate (also called Gross Fertility Rate) describes the total number of live births per 1,000 population in a given year.

General Fertility Rate (GFR)

The General Fertility Rate (also called the fertility rate) is the ratio of the number of live births in a given year per 1000 women of reproductive age (i.e. 15-49 years) in the same time period. The General Fertility Rate is much more accurate than the Crude Birth Rate.

Age-Specific Fertility Rate

The number of births to women of a given age group per 1,000 women in that age group.

Total Fertility Rate (TFR)

The Total Fertility Rate is the number of children which a woman of a hypothetical cohort would bear during her life time if she were to bear children throughout her life at the rates specified by the schedule of age specific fertility rates for a particular year and if she were to survive until the end of her reproductive life. Therefore, the total fertility rate is the number of births a woman would have if she experienced a given set of age specific birth rates throughout her reproductive life. It is the sum of age-specific fertility rates.

Fertility Replacement Rate (FRR)

The Fertility Replacement Rate (FRR) is the average number of daughters that would be born to a woman (or group of women) during her lifetime if she passed through her childbearing years conforming to the age-specific fertility rate of a given year. This rate is like TFR except that it counts only daughters and literally measures “reproduction” i.e. a woman reproducing herself by having a daughter.

Crude Death Rate

The number of population deaths divided by the total population in a given year, multiplied by 1,000.

Age-Specific Death Rate (ASDR)

Death rates can also be calculated for specific age groups to compare mortality rates for different ages or at the same age. Comparisons can be made between countries or regions. Because mortality rates vary widely by gender and ethnicity, mortality by age is given separately for men and women and for different ethnic groups within the population. The age-specific death rate is the number of those dying in a specific age group divided by the population in the same age group, multiplied by 1,000.

Infant Mortality Rate (IMR)

Infant mortality is number of deaths of those aged under one year old, per 1,000 live births in a given year.

Child Mortality Rate (CMR)

The child mortality rate is the number of deaths of those aged 1 to 4-years old, per 1000 children aged 1-4 years old in a given year.

Maternal Mortality Rate (MMR)

This is the number of maternal deaths (i.e. women who died during pregnancy, childbirth or within 42 days after birth) in a particular time period, per 100,000 live births in the same time period.

Defining disability

The Convention on the Rights of Persons with Disabilities defines disability as a result of the interaction between persons with impairments and attitudinal and environmental barriers that hinder their full and effective participation in society on an equal basis with others. This definition is in line with the International Classification of Functioning, Disability and Health (ICF), suggesting that disability is neither a purely medical nor a purely social condition. These definitions reflect a conceptualization of disability that places it on a spectrum of functioning difficulties. Hence disability measurement must reflect this spectrum with necessary cut-off points. The GPCC 2019 adopted the Washington Group Short Set of Questions on Disability, which was inspired by the ICF. The Washington Group questions comprises six questions according to six functional domains – seeing, hearing, walking, remembering or concentrating, self-care and communicating – along an ascending scale of difficulty of “none”, “some”, “a lot” and “cannot do at all”.

The Washington Group Short Set of Questions on Disability focuses on measuring the level of functioning difficulty experienced in performing basic actions, rather than the existence of a health condition or impairment. The measure was designed primarily for international comparison. The Washington Group on Disability Statistics recommends that persons with disabilities be defined as those who experience a lot of difficulty or cannot operate at all in at least one of the six functional domains

Disability questions contained in the General Population Census of Cambodia 2019 for persons aged 5 years or older

1. Do you have difficulty seeing, even if wearing glasses?
 - a. No – no difficulty
 - b. Yes – some difficulty
 - c. Yes – a lot of difficulty
 - d. Cannot do at all.
2. Do you have difficulty hearing, even if using a hearing aid?
 - a. No – no difficulty
 - b. Yes – some difficulty
 - c. Yes – a lot of difficulty
 - d. Cannot do at all.
3. Do you have difficulty walking or climbing steps?
 - a. No – no difficulty
 - b. Yes – some difficulty
 - c. Yes – a lot of difficulty
 - d. Cannot do at all.
4. Do you have difficulty remembering or concentrating?
 - a. No – no difficulty
 - b. Yes – some difficulty
 - c. Yes – a lot of difficulty
 - d. Cannot do at all.
5. Do you have difficulty with self-care such as washing all over or dressing?
 - a. No – no difficulty
 - b. Yes – some difficulty
 - c. Yes – a lot of difficulty
 - d. Cannot do at all.
6. Because of a physical, mental or emotional health condition, do you have difficulty communicating (for example, understanding others or others understanding you)?
 - a. No – no difficulty
 - b. Yes – some difficulty
 - c. Yes – a lot of difficulty
 - d. Cannot do at all.

(iii)	
12.	C1 Population by Major Activity Status, 5-year Age Group and Sex.
13.	C2 Employed Persons aged 5 and over by Status in Employment, Age Group and Sex.
14.	C3 Employed Persons aged 5 and over by Sector of Employment, Age Group and Sex.
15.	C4 Unemployed Persons aged 5 and over by Status in last Employment, Age Group and Sex.
16.	C5 Employed Persons aged 5 and over by Employment Status, Age Group and Sex.
17.	C5A Employed Persons aged 5 and over by Age Group, Sex and Area.
18.	C6 Economically Active Population aged 5 and over by Major Group of Occupation and Sex
19.	C7 Economically Inactive Population aged 5 and over by Functional Categories, Age Group and Sex.
20.	C8 Employed Population aged 5 and over by Economic Activity, Age Group and Sex
21.	C9 Employed Population aged 5 and over by Major Group of Occupation, Age Group and Sex.
22.	C10 Employed Population aged 5 and over by Major Status in Employment, Industry and Sex.
23.	C11 Employed Population aged 5 and over by Major Status in Employment, Occupation and Sex.
24.	C12 Employed Population aged 5 and over by Literacy in any language, Level of Education, Occupation and Sex.
25.	C15 Employed Female Population aged 5 and over by Economic Activity, Marital Status and Sex.
26.	C16 Employed Female Population aged 5 and over by Occupational Group, Marital Status and Sex.
27.	C17 Employed Population aged 5 to 20 by School Attendance, Single Year of Age and Sex.
D Series. Migration Tables	
(iv)	
28.	D1 Migrants classified by Place of Last Residence, Duration of Residence in Place of Enumeration and Sex.

29. D2 Migrants from other Provinces classified by Province of Enumeration, Province of Previous Residence, Duration of Stay and Sex.
30. D3 Migrants by Place of Last Residence, Reason for Migration, Duration of Residence and Sex.
31. D4 Migrants Economically Active Population aged 5 and over by Place of Last Residence, Economic Activity, and Sex.
32. D5 Migrants Economically Active Population aged 5 and over by Place of Last Residence, Major Group of Occupation and Sex.
33. D6 Migrants from Place of Last Residence aged 7 and over by Educational Level, Major Activity Status, Age Group and Sex.
34. D7 Migrants in the previous five years by Age Group and Sex.
- (v) **E Series. Disability Tables**
35. E1 (Revised) Physically/Mentally Disabled Persons aged 5 and over by Status of disability, Sex, and Capital\Province.
36. E2 (Revised) Physically/Mentally Disabled Persons aged 5 and over by Category of Disability, Level of Disability, Sex, and Age Group.
37. E3 (Revised) Physically/Mentally Disabled Persons aged 5 and over by Category of Disability, Level of Disability and Capital\Province.
38. E4 (Revised) Physically/Mentally Disabled Persons aged 5 and over by Category of Disability, Level of Disability and Area.
39. E5 (Revised) Physically/Mentally Disabled Persons aged 5 and over by Category of Household, Level of Disability, Sex and Age Group.
40. E6 (Revised) Physically/Mentally Disabled Persons aged 5 and over by Communication of Head of Household and Sex.
41. E7 (Revised) Physically/Mentally Disabled Persons aged 10 and over by Category of Disability, Marital Status, Sex and Area.

42.	E8A	(New) Physically/Mentally Disabled Persons by Level of Disability, Status of School Attendant, Age Group, Sex and Area.
43.	E8B	(New) Physically/Mentally Disabled Persons aged 5 and over by Level of Disability, Literacy of any language, Age Group, Sex and Area.
44.	E9	Physically/Mentally Disabled Persons aged 5 and over by Level of Education, Sex and Area.
45.	E10A E11A	Physically/Mentally Disabled Persons aged 5 and over by Level of Disability, Major Activity, Age Group, Sex and Area.
46.	E10b E11b	Physically/Mentally Disabled Persons aged 15-49 by Level of Disability, Major Activity, Age Group, Sex and Area.
47.	E12a	Physically/Mentally Disabled Persons aged 15-49 by Category of Disability, Level of Disability, Major Occupation, Sex and Area.
48.	E12b	Physically/Mentally Disabled Persons aged 15-49 by Category of Disability, Level of Disability, Major Group of Economic Activity, Sex and Area.
	(vi)	F Series. Fertility Tables
49.	F1	Number of Children bear from females aged 15 to 49 during last 12 months by Age Group, Educational level, Birth order, Sex and Area.
50.	F2	Number of Children bear from females aged 15 to 49 during last 12 months by Age Group, Major Activity, Birth order, Sex and Area.
51.	F3	Number of Children bear from females aged 15 and over by Birth Order, Age Group, Education Level, Sex and Area.
52.	F4	Number of Children bear from females aged 15 and over by Birth Order, Age Group, Major Activity, Sex and Area.
53.	F5	Number of Children bear from females aged 15 and over by Number of Surviving Children, Age Group, Educational level, Sex and Area.
54.	F6	Number of Children bear from females aged 15 and over by Number of Surviving Children, Age Group, Major Activity, Sex and Area.

55.	F7	Number of Children bear from females aged 15 to 49 during last 12 months by Age Group, Type of Assistance during Delivery, Sex and Area.
	(vii)	G Series. Mortality Tables
56.	G1	Number of Households death in the last 12 months by Age Group, Sex and Area.
57.	G2	Number of Households death in the last 12 months by Cause of Death, Age Group and Sex.
58.	G3	Maternal Deaths by Type of Assistance when dead, Place of Death and Age Group.
59.	G4	(New) Number of Households death in last 12 months by Age Group and Death Registration.
	(viii)	H Series. Household and Housing Amenity Tables
60.	H1	Buildings/Structures with Households by Type of Use.
61.	H2	Buildings/Structures (Residential + Partly Residential) by Predominant material of Roof, Wall and Floor.
62.	H3	Households by Tenure Status of Dwelling, Household Size and Number of Rooms Occupied.
63.	H4	Households by Size of Households, Number of Economically Active Members and Sex of Head of Household
64.	H5	Head of Households (aged 10 and over) by Major Activity Status, 5-year Age Group and Sex.
65.	H6	Households by Major source of Light used and Household Size.
66.	H7	Households by Type of Fuel used for Cooking and Household Size.
67.	H8	Households classified by Major source of Drinking Water, Location of Source and Household Size.
68.	H9	Households by Tenure Status of Dwelling and Toilet Facility Category.
69.	H10	Households and Population (in 10,000's) by Tenure Status of Dwelling, Availability of Electric Power and Toilet Facility.
70.	H11	Households classified by source of Drinking Water, Availability of Electric Power and Toilet Facility.
71.	H12	(Revised) Households by Type and Number of Assets owned.

72. H13 (Revised) Households by Household Size and Access to Internet.
73. H14 (New) Households and Population by Type of Household.
